# NASA STI Program ... in Profile

Since its founding, NASA has been dedicated to the advancement of aeronautics and space science. The NASA Scientific and Technical Information (STI) Program plays a key part in helping NASA maintain this important role.

The NASA STI Program provides access to the NASA Aeronautics and Space Database, the largest collection of aeronautical and space science in the world. The STI Program is also NASA's institutional mechanism for disseminating the results of its research and development activities. These results are published by NASA in the NASA STI Report Series, which includes the following report types:

- **TECHNICAL PUBLICATION.** Reports of completed research or major significant phases of research that present the results of NASA programs and include extensive data or theoretical analysis. Includes compilations of significant scientific and technical data and information deemed of continuing reference value. NASA counterpart of peer-reviewed formal professional papers, but has less stringent limitations on manuscript length and extent of graphic presentations.
- **TECHNICAL MEMORANDUM.** Scientific and technical findings that are of preliminary or specialized interest, e.g., quick release reports, working papers, and bibliographies that contain minimal annotation. Does not contain extensive analysis.
- **CONTRACTOR REPORT.** Scientific and technical findings by NASA-sponsored contractors and grantees.
- **CONFERENCE PUBLICATION.** Collected papers from scientific and technical conferences, symposia, seminars, or other meetings sponsored or co-sponsored by NASA.

- **SPECIAL PUBLICATION.** Scientific, technical, or historical information from NASA programs, projects, and missions, often concerned with subjects having substantial public interest.
- **TECHNICAL TRANSLATION.** English-language translations of foreign scientific and technical material pertinent to NASA's mission.

Specialized services that help round out the STI Program's diverse offerings include creating custom thesauri, building customized databases, organizing and publishing research results ... even providing videos.

The NASA STI Program is managed by the NASA STI Program Office (STIPO). STIPO is the administrative office at Langley Research Center for the NASA STI Program.

For more information about the NASA STI Program, you can:

- Access the NASA STI Program Home Page at <http://www.sti.nasa.gov>
- E-mail your question via the Internet to [help@sti.nasa.gov](mailto:help@sti.nasa.gov)
- Fax your question to the NASA STI Help Desk at (301) 621-0134
- Telephone the NASA STI Help Desk at (301) 621-0390

# Introduction

*Scientific and Technical Aerospace Reports (STAR)* is an online information resource listing citations and abstracts of NASA and world wide aerospace-related STI. Updated biweekly, *STAR* highlights the most recent additions to the NASA Aeronautics and Space Database. Through this resource, the NASA STI Program provides timely access to the most current aerospace-related Research & Development (R&D) results.

*STAR* subject coverage includes all aspects of aeronautics and space research and development, supporting basic and applied research, and application, as well as aerospace aspects of Earth resources, energy development, conservation, oceanography, environmental protection, urban transportation and other topics of high national priority. The listing is arranged first by 11 broad subject divisions, then within these divisions by 76 subject categories and includes two indexes: subject and author.

*STAR* includes citations to Research & Development (R&D) results reported in:

- NASA, NASA contractor, and NASA grantee reports
- Reports issued by other U.S. Government agencies, domestic and foreign institution, universities, and private firms
- Translations
- NASA-owned patents and patent applications
- Other U.S. Government agency and foreign patents and patent applications
- Domestic and foreign dissertations and theses

## The NASA STI Program

The NASA Scientific and Technical Information (STI) Program was established to support the objectives of NASA's missions and research to advance aeronautics and space science. By sharing information, the NASA STI Program ensures that the U.S. maintains its preeminence in aerospace-related industries and education, minimizes duplication of research, and increases research productivity.

Through the NASA Center for AeroSpace Information (CASI), the NASA STI Program acquires, processes, archives, announces and disseminates both NASA's internal STI and world-wide STI. The results of 20th and 21st century aeronautics and aerospace research and development, a worldwide investment totaling billions of dollars, have been captured, organized, and stored in the NASA Aeronautics and Space Database. New information is continually announced and made available as it is acquired, making this a dynamic and historical collection of value to business, industry, academia, federal institutions, and the general public.

The STI Program offers products and tools that allow efficient access to the wealth of information derived from global R&D efforts. In addition, customized services are available to help tailor this valuable resource to meet your specific needs.

For more information on the most up to date NASA STI, visit the STI Program's website at <http://www.sti.nasa.gov>.

# NASA STI Availability Information

## NASA Center for AeroSpace Information (CASI)

Through NASA CASI, the NASA STI Program offers many information products and services to the aerospace community and to the public, including access to a selection of full text of the NASA STI. Free registration with the program is available to NASA, U.S. Government agencies and contractors. To register, contact CASI at [help@sti.nasa.gov](mailto:help@sti.nasa.gov). Others should visit the program at [www.sti.nasa.gov](http://www.sti.nasa.gov). The 'search selected databases' button provides access to the NASA Technical Reports Server (TRS) – the publicly available contents of the NASA Aeronautics and Space Database.

Each citation in *STAR* indicates a 'Source of Availability'. When CASI is indicated, the user can order this information directly from CASI using the [STI Online Order Form](#) or contact [help@sti.nasa.gov](mailto:help@sti.nasa.gov) or telephone the CASI Help Desk at 301-621-0390. Before ordering you may access price code tables for STI [documents](#) and [videos](#). When information is not available from CASI, the source of the information is indicated when known.

NASA STI is also available to the public through Federal information organizations. NASA CASI disseminates publicly available NASA STI to the National Technical Information Service (NTIS) and to the Federal Depository Library Program (FDLP) through the Government Printing Office (GPO). In addition, NASA patents are available online from the U.S. Patent and Trademark Office.

## National Technical Information Service (NTIS)

The National Technical Information Service serves the American public as a central resource for unlimited, unclassified U.S. Government scientific, technical, engineering, and business related information. For more than 50 years NTIS has provided businesses, universities, and the public timely access to well over 2 million publications covering over 350 subject areas. Visit NTIS at <http://www.ntis.gov>.

## The Federal Depository Library Program (FDLP)

The U.S. Congress established the **Federal Depository Library Program** (FDLP) to ensure access by the American public to U.S. Government information. The program acquires and disseminates information products from all three branches of the U.S. Government to nearly 1,300 Federal depository libraries nationwide. The libraries maintain these information products as part of their existing collections and are responsible for assuring that the public has free access to the information. Locate the Federal Depository Libraries [http://www.access.gpo.gov/su\\_docs](http://www.access.gpo.gov/su_docs).

## The U.S. Patent and Trademark Office (USPTO)

The U.S. Patent and Trademark Office provides online access to full text patents and patent applications. The database includes patents back to 1976 plus some pre-1975 patents. Visit the USPTO at <http://www.uspto.gov/patft/>.

Report No.(s): AD-A418282; AFRL-HE-WP-TR-2003-0084; No Copyright; Avail: CASI; [A11](#), Hardcopy

For nearly 30 years, the Crew System Interface Division (HEC; [www.hec.af.mil](http://www.hec.af.mil)) of the Air Force Research Laboratory (ARRL), located at Wright-Patterson AFB OH, has advanced aerospace transparency technology through the investigative research of numerous optical and visual parameters inherent in aerospace transparencies. This document contains reprints of four publications by AFRL/ HEC, which provide an overview of various optical characteristics, visual effects and other issues associated with aircraft transparencies. Also included is an annotated bibliography of in-house publications, a bibliography of additional transparency-related publications plus listings of standardized test methods and related patent abstracts.

##### **Validation of Variations in Mental Workload as a Function of Scenario Difficulty: Traffic Density and Visibility**

[2003]; 10 pp.; In English; Original contains black and white illustrations

Contract(s)/Grant(s): NAG1-03020; Proj. 131881; No Copyright; Avail: CASI; [A02](#), Hardcopy

Fluctuations in mental workload can be expected as a function of traffic density and visibility. The aim of the current investigation was to establish simulation scenarios that differed in attentional processing requirements. Four scenarios were created and tested representing two levels of traffic density (urban versus freeway) and two levels of visibility (clear versus foggy). An array of mental workload assessment measures were used to exam changes in attentional processing requirements in each scenario. The assessment array consisted of physiological (P300 amplitude and latency) and behavioral (RT and accuracy) indices. Preliminary results indicate that workload differs significantly as a function of traffic density in rural versus freeway scenarios. Workload also differs significantly in rural versus freeway scenarios as a function of visibility as observed by a significant interaction between the two variables of interest. Results are discussed in terms of their application for validating the difficulty level of simulation scenarios as a format for examining mental workload.

##### **A Simulation of the I3 to D Repair Process and Sparing of the F414-GE-400 Jet Aircraft Engine**

Schoch, Eric J.; Sep. 2003; 171 pp.; In English; Original contains color illustrations

Report No.(s): AD-A418270; No Copyright; Avail: CASI; [A08](#), Hardcopy

The F/A-18E/F is the latest multi-mission tactical aircraft to enter USA Naval Service. it generates power via two F414-GE-400 engines, each of which is composed of six modules. In addition to a new aircraft model and engines, a new concept, the 13 to D Repair Process, is being used for F414-GE-400 module and engine repair. In the 13 to D Repair Process, the intermediate level no longer repairs modules. Instead, the depot level performs all module repairs. This thesis develops and exercises a simulation of the 13 to D Repair Process for the F414-GE-400 by incorporating simulated F/A-18E/F flight schedules and engine failures to populate the repair cycle. The simulation provides operational availability (A0) and probability to spare the repair process given an infrastructure and sparing profile. Three previous years of module failures and depot repair times are used to calibrate the model. Simulation results for the baseline studied showed the distinct influence of certain input parameters.

#### **Embedded Wing Propulsion Conceptual Study**

Kim, Hyun D.; Saunders, John D.; November 2003; 17 pp.; In English; Vehicle Propulsion Integration Symposium, 6-9 Oct. 2003, Warsaw, Poland; Original contains color and black and white illustrations

Contract(s)/Grant(s): WBS 22-708-87-19

Report No.(s): NASA/TM-2003-212696; E-14199; NAS 1.15:212696; No Copyright; Avail: CASI; **A03**, Hardcopy

As a part of distributed propulsion work under NASA's Revolutionary Aeropropulsion Concepts or RAC project, a new propulsion-airframe integrated vehicle concept called Embedded Wing Propulsion (EWP) is developed and examined through system and computational fluid dynamics (CFD) studies. The idea behind the concept is to fully integrate a propulsion system within a wing structure so that the aircraft takes full benefits of coupling of wing aerodynamics and the propulsion thrust stream. The objective of this study is to assess the feasibility of the EWP concept applied to large transport aircraft such as the Blended-Wing-Body aircraft. In this paper, some of early analysis and current status of the study are presented. In addition, other current activities of distributed propulsion under the RAC project are briefly discussed.

**20030113049** Tennessee Univ. Space Inst., Tullahoma, TN, USA

#### **Pulsed Ejector Wave Propagation Test Program**

Fernandez, Rene; Slater, John W.; Paxson, Daniel E.; Confined Detonations and Pulse Detonation Engines; February 28, 2003, pp. 311-334; In English

Contract(s)/Grant(s): 708-48-13; Copyright; Avail: Other Sources

The development of, and initial test data from, a nondetonating Pulse Detonation Engine (PDE) simulator tested in the NASA Glenn 1 x 1 foot Supersonic Wind Tunnel (SWT) is presented in this paper. The concept is a pulsed ejector driven by the simulated exhaust of a PDE. This program is applicable to a PDE entombed in a ramjet flowpath, i.e., a PDE combined-cycle propulsion system. The ejector primary flow is a pulsed, underexpanded, supersonic nozzle simulating the supersonic waves emanating from a PDE, while the ejector secondary flow is the 1 x 1 foot SWT test section operated at subsonic Mach numbers. The objective is not to study the detonation details, but the wave physics including the starting vortices, the extent of propagation of the wave front, the reflection of the wave from the secondary flowpath walls, and the timing of these events of a pulsed ejector, and correlate these with Computational Fluid Dynamics (CFD) code predictions. Pulsed ejectors have been shown to result in a 3 to 1 improvement in L/D (length-to-diameter) and a near 2 to 1 improvement in thrust augmentation over a steady ejector. This program will also explore the extent of upstream interactions between an inlet and large, periodically applied, backpressures to the inlet as would be present due to combustion tube detonations in a PDE. These interactions could result in inlet unstart or buzz for a supersonic mixed compression inlet. The design of the present experiment entailed the use of an 2-t diagram characteristics code to study the nozzle filling and purging timescales as well as a series of CFD analyses conducted using the WIND code. The WIND code is a general purpose CFD code for

solution of the Reynolds averaged Navier-Stokes equations and can be applied to both steady state and time-accurate calculations. The first, proof-of-concept, test entry (spring 2001) pressure distributions shown here indicate the simulation concept was successful and therefore the experimental approach is sound.

## 08

### AIRCRAFT STABILITY AND CONTROL

Includes flight dynamics, aircraft handling qualities, piloting, flight controls, and autopilots. For related information see also *05 Aircraft Design, Testing and Performance* and *06 Avionics and Aircraft Instrumentation*.

**20030112874** NASA Dryden Flight Research Center, Edwards, CA, USA

#### **Integration of Online Parameter Identification and Neural Network for In-Flight Adaptive Control**

Hageman, Jacob; Smith, Mark; Stachowiak, Susan; [2003]; 16 pp.; In English; AIAA Atmospheric Flight Mechanics Conference and Exhibit, 11-14 Aug. 2003, Austin, TX, USA; Original contains color and black and white illustrations

Report No.(s): AIAA Paper 2003-5700; Copyright; Avail: CASI; [A03](#), Hardcopy

An indirect adaptive system has been constructed for robust control of an aircraft with uncertain aerodynamic characteristics. This system consists of a multilayer perceptron pre-trained neural network, online stability and control derivative identification, a dynamic cell structure online learning neural network, and a model following control system based on the stochastic optimal feedforward and feedback technique. The pre-trained neural network and model following control system have been flight-tested, but the online parameter identification and online learning neural network are new additions used for in-flight adaptation of the control system model. A description of the modification and integration of these two stand-alone software packages into the complete system in preparation for initial flight tests is presented. Open-loop results using both simulation and flight data, as well as closed-loop performance of the complete system in a nonlinear, six-degree-of-freedom, flight validated simulation, are analyzed. Results show that this online learning system, in contrast to the nonlearning system, has the ability to adapt to changes in aerodynamic characteristics in a real-time, closed-loop, piloted simulation, resulting in improved flying qualities.

### RESEARCH AND SUPPORT FACILITIES (AIR)

Includes airports, runways, hangars, and aircraft repair and overhaul facilities; wind tunnels, water tunnels, and shock tubes; flight simulators; and aircraft engine test stands. Also includes airport ground equipment and systems. For airport ground operations see *03 Air Transportation and Safety*. For astronomical facilities see *14 Ground Support Systems and Facilities (Space)*.

**20030112897** National Aerospace Lab., Tokyo

#### **Technical Report of National Aerospace Laboratory Management for the NAL 1.27m Hypersonic Wind Tunnel**

Nagai, S.; Tsuda, S.; Koyama, T.; Hirabayashi, N.; Sekine, H.; 2001; 18 pp.; In Japanese

Report No.(s): PB2004-100467; NAL-TR-1436; Copyright; Avail: National Technical Information Service (NTIS)

Variation of pitot pressure was observed in a Mach 10 nozzle calibration test of the National Aerospace Laboratory 1.27m hypersonic wind tunnel immediately after a humid combustion gas evacuation system was added to the air heater. The mix of humidity provided by condensed water inside the tunnel structure was evaluated using run-by-run variations of evacuated heater pressure and of measured humidity level in the working air. The calibration data were also examined and a non-isentropic condensing flow through the nozzle was believed to have occurred. Thus modifications to prevent condensing of water were carried out and constant pitot pressure was obtained in a further calibration test. A statistical assessment was made of the data obtained before and after these modifications, and the results were compared to confirm the existence of a repeatable isentropic flow. This allowed efficient humidity management within the operation cycle. The water-effect free flow was assured by monitoring the humidity level and nozzle exit wall pressure.

**Dual-Spool Turbine Facility Design Overview**

Giel, Paul; Pachlhofer, Pete; May 1, 2003; 20 pp.; In English; AIAA TETWOG Meeting, 1-2 May 2003, Cincinnati, OH, USA; Original contains color illustrations

Contract(s)/Grant(s): NAS3-00145; WBS 22-714-03-58; No Copyright; Avail: CASI; [A03](#), Hardcopy

The next generation of aircraft engines, both commercial and military, will attempt to capitalize on the benefits of close-coupled, vaneless, counter-rotating turbine systems. Experience has shown that significant risks and challenges are present with close-coupled systems in terms of efficiency and durability. The UEET program needs to demonstrate aerodynamic loading and efficiency goals for close-coupled, reduced-stage HP/LP turbine systems as a Level 1 Milestone for FY05. No research facility exists in the U.S. to provide risk reduction for successful development of close-coupled, high and low pressure turbine systems for the next generations of engines. To meet these objectives, the design, construction, and integrated systems testing of a Dual-Spool Turbine Facility (DSTF) facility has been initiated at the NASA Glenn Research Center. The facility will be a warm (-1000°F), continuous flow facility for overall aerodynamic performance and detailed flow field measurement acquisition. The facility will have state-of-the-art instrumentation to capture flow physics details. Accurate and reliable speed control will be achieved by utilizing the existing Variable Frequency Drive System. Utilization of this and other existing GRC centralized utilities will reduce the overall construction costs. The design allows for future installation of a turbine inlet combustor profile simulator. This presentation details the objectives of the facility and the concepts used in specifying its capabilities. Some preliminary design results will be presented along with a discussion of plans and schedules.

**20030112985** Connecticut Univ., Storrs, CT, USA

**New Polymers and Processes for Space Applications**

Mather, Patrick T.; Nov. 5, 2003; 9 pp.; In English

Contract(s)/Grant(s): F49620-00-1-0100; Proj-2303

Report No.(s): AD-A418326; AFRL-SR-AR-TR-03-0474; No Copyright; Avail: CASI; [A02](#), Hardcopy

The overall objective of this proposal was to conceive and develop new polymeric materials and processes for emerging Air Force applications that are space-based. Specifically, we developed new thermoset materials, including nanostructured and liquid crystalline thermosets, with enhanced use temperature and fracture toughness beyond state-of-practice materials. Additionally, we developed new polymer processing methods to achieve concave polymer films with tailored shape. Three distinct thermosetting systems were compared in terms of viability for combined T<sub>g</sub> and fracture toughness enhancement, while maintaining or improving processability over state-of-the-art resin systems. The particular systems studied include: (i) epoxy resins modified by inorganic-organic hybrid POSS compounds, (ii) liquid crystalline thermosets, and (iii) reactive hyperbranched polymeric additives for bismaleimide-polyhedral oligomeric silsesquioxane (BMI-POSS) epoxies. During this program, two graduate assistants were supported, Mr. Haihu Qin (full support) and Mr. Jian Wu (partial support), as well as a postdoctoral researcher, Dr. Gyeong-Man Kim (full support); all through whom significant progress has been made.

### **Technical Report of National Aerospace Laboratory. Teleoperation with Time Delay. A Survey and Its Use in Space Robotics**

Penn, L. F.; Matsumoto, K.; Feb. 2003; 34 pp.; In English

Report No.(s): PB2004-100469; NAL-TR-1438T; Copyright; Avail: National Technical Information Service (NTIS)

The existence of time delay in the communication link is one of the most important problems regarding the stability of teleoperation systems. Space robot systems and on-orbit telerobotics technology will play an essential role in the construction and maintenance of large-scale structures, such as the International Space Station (ISS), but it is well known that in Earth orbit space applications the total cycle time is usually of 7 s. Many proposals have appeared in the literature through the years on how to conduct time-delayed teleoperation, but to date no comprehensive comparison study between them has been carried out. In this context, we decided to conduct a survey of all the proposals for time-delayed teleoperation present so far in the literature and compare them on the same grounds. This will give researchers in this field a better understanding of the problem and will help them have a clear view as to in what areas more research is needed to achieve continuous and smooth teleoperation in the presence of time delay. We have focused our study on the continuous teleoperation of robotic arms on orbit around the Earth. This will be the area of space robotics applications with the greatest demand in the following years. Special emphasis has been put throughout the study on the specific operational characteristics of this type of system. Finally, we have proposed a framework for future research in the field. The framework is based on the definition of a nomenclature and a data flow diagram in which to express in a concise and compact way different algorithms. The utility of this framework is demonstrated both with a general example and with its application to different proposals present in the literature.

### **Next Generation of Hall Thrusters for Space Propulsion**

Keith, Theo G., Jr.; Manzella, David; December 2003; 5 pp.; In English

Contract(s)/Grant(s): NCC3-855; No Copyright; Avail: CASI; [A01](#), Hardcopy

During the previous year, grant activity research focused on demonstrating high thrust/power operation of Hall thrusters. Performance of a low power and a high power Hall thruster was experimentally investigated at discharge voltages from 100 to 150 volts. Discharge efficiencies dropped significantly as discharge voltage was decreased over this range. Reductions in discharge efficiency with decreasing discharge voltage were attributed to reductions in ionization efficiency and/or ion acceleration through a potential less than the applied discharge voltage relative to the performance of state-of-art Hall thrusters operating at discharge voltages of 300 Volts and above. The low power Hall thruster exhibited a more pronounced reduction in discharge efficiency with decreasing discharge voltage. This was attributed to increased electron leakage related to the axial distribution of the radial magnetic field. These data demonstrated that the thrust benefit of operating at discharge voltages below 130 Volts was offset by a corresponding decrease in discharge efficiency for a given input power. Additional activities included continued support of on-going Hall thruster propulsion research within the On-Board Propulsion Branch at NASA Glenn Research Center.

**Vibration Testing of Stirling Power Convertors**

Hughes, Bill; Goodnight, Thomas; McNelis, Mark E.; Suarez, Vicente J.; Schreiber, Jeff; Samorezov, Sergey; [2003]; 2 pp.; In English; AIAA/ICAS International Air and Space Symposium and Exposition: The Next 100 Years, 14-17 Jul. 2003, Dayton, OH, USA; Original contains black and white illustrations

Contract(s)/Grant(s): WBS 22-979-30-01; No Copyright; Avail: Other Sources; Abstract Only

The NASA John H. Glenn Research Center (GRC) and the U.S. Department of Energy (DOE) are currently developing a high efficient, long life, free piston Stirling convertor for use as an advanced spacecraft power system for future NASA missions. As part of this development, a Stirling Technology Demonstrator Convertor (TDC), developed by Stirling Technology Company (STC) for DOE, was vibration tested at GRC's Structural Dynamics Laboratory (SDU7735) in November- December 1999. This testing demonstrated that the Stirling TDC is able to withstand the harsh random vibration (20 to 2000 Hertz) seen during a typical spacecraft launch and survive with no structural damage or functional power performance degradation, thereby enabling its usage in future spacecraft power systems. The Stirling Vibration Test Team at NASA GRC and STC personnel conducted tests on a single 55 electric watt TDC. The purpose was to characterize the TDC's structural response to vibration and determine if the TDC could survive the vibration criteria established by the Jet Propulsion Laboratory (JPL) for launch environments. The TDC was operated at full-stroke and full power conditions during the vibration testing. The TDC was tested in two orientations, with the direction of vibration parallel and perpendicular to the TDC's moving components (displacer and piston). The TDC successfully passed a series of sine and random vibration tests. The most severe test was a 12.3 Grms random vibration test (peak vibration level of 0.2 g<sup>2</sup>/Hz from 50 to 250 Hertz) with test durations of 3 minutes per axis. The random vibration test levels were chosen to simulate, with margin, the maximum anticipated launch vibration conditions. As a result of this very successful vibration testing and successful evaluations in other key technical readiness areas, the Stirling power system is now considered a viable technology for future application for NASA spacecraft missions. Possible usage of the Stirling power system would be to supply on-board electric spacecraft power for future NASA Deep-Space Missions, performing as an attractive alternative to Radioisotope Thermoelectric Generators (RTG). Usage of the Stirling technology is also being considered as the electric power source for future Mars rovers, whose mission profiles may exclude the use of photovoltaic power systems (such as exploring at high Martian latitudes or for missions of lengthy durations). GRC's Thermo-Mechanical Systems Branch (5490) provides Stirling technology expertise under a Space Act Agreement with the DOE. Additional vibration testing, by GRC's Structural Systems Dynamics Branch (7733), is planned to continue to demonstrate the Stirling power system's vibration capability as its technology and flight system designs progress.

**Nucleation Behavior of Oxygen-Acetylene Torch-Produced Diamond Films**

Roberts, F. E.; November 2003; 1 pp.; In English

Report No.(s): NASA/TP-2003-212929; M-1094; No Copyright; Avail: Other Sources; Abstract Only

A mechanism is presented for the nucleation of diamond in the combustion flame environment. A series of six experiments and two associated simulations provide results from which the mechanism was derived. A substantial portion of the prior literature was reviewed and the data and conclusions from the previous experimenters were found to support the proposed mechanism. The nucleation mechanism builds on the work of previous researchers but presents an approach to nucleation in a detail and direction not fully presented heretofore. This work identifies the gas phase as the controlling environment for the initial formation steps leading to nucleation. The developed mechanism explains some of the difficulty which has been found in producing single crystal epitaxial films. An experiment which modified the initial gas phase precursor using methane and carbon monoxide is presented. Addition of methane into the precursor gases was found to be responsible for pillaring of the films. Atomic force microscopy surface roughness data provides a reasonable look at suppression of nucleation by carbon monoxide. Surface finish data was taken on crystals which were open to the nucleation environment and generally parallel to the substrate surface. The test surfaces were measured as an independent measure of the instantaneous nucleation environment. A gas flow and substrate experiment changed the conditions on the surface of the sample by increasing the gas flow rate while remaining on a consistent point of the atomic constituent diagram, and by changing the carbide potential of the substrate. Two tip modification experiments looked at the behavior of gas phase nucleation by modifying the shape and behavior of the flame plasma in which the diamond nucleation is suspected to occur. Diamond nucleation and growth was additionally examined

using a high-velocity oxygen fuel gun and C<sub>3</sub>H<sub>6</sub> as the fuel gas phase precursor with addition of carbon monoxide gas 01 addition of liquid toluene.

#### **A Model for the Oxidation of C/SiC Composite Structures**

Sullivan, Roy M.; November 2003; 20 pp.; In English; Original contains black and white illustrations

Contract(s)/Grant(s): WBS 22-706-85-04

Report No.(s): NASA/TM-2003-212720; E-14244; No Copyright; Avail: CASI; [A03](#), Hardcopy

A mathematical theory and an accompanying numerical scheme have been developed for predicting the oxidation behavior of C/SiC composite structures. The theory is derived from the mechanics of the flow of ideal gases through a porous solid. Within the mathematical formulation, two diffusion mechanisms are possible: (1) the relative diffusion of one species with respect to the mixture, which is concentration gradient driven and (2) the diffusion associated with the average velocity of the gas mixture, which is total gas pressure gradient driven. The result of the theoretical formulation is a set of two coupled nonlinear differential equations written in terms of the oxidant and oxide partial pressures. The differential equations must be solved simultaneously to obtain the partial vapor pressures of the oxidant and oxides as a function of space and time. The local rate of carbon oxidation is determined as a function of space and time using the map of the local oxidant partial vapor pressure along with the Arrhenius rate equation. The nonlinear differential equations are cast into matrix equations by applying the Bubnov-Galerkin weighted residual method, allowing for the solution of the differential equations numerically. The end result is a numerical scheme capable of determining the variation of the local carbon oxidation rates as a function of space and time for any arbitrary C/SiC composite structures.

#### **Acoustic Emission and Damage Monitoring During Fatigue of C-SiC Composites at Room Temperature**

Morscher, Gregory N.; Deemer, Chris; Cuneo, Jacques; Smith, Aron; Koenig, John; [2003]; 24 pp.; In English; National Space and Missile Materials Symposium, 23-27 Jun. 2003, San Diego, CA, USA

Contract(s)/Grant(s): 22-713-82-32; No Copyright; Avail: CASI; [A03](#), Hardcopy

Fatigue experiments were performed at room temperature for C-fiber reinforced chemical vapor infiltrated (CVI Sic) matrix and melt-infiltrated (MI) matrix composites. The goal was to associate some nondestructive parameter or acoustic emission characteristic with the processes that lead to fatigue failure. Failure only occurred at loads very close to the ultimate. However, correlations between the acoustic data and the eventual failure of the composites could be made. These will be presented with respect to health monitoring of these types of composites.

#### **Mechanical Properties of Triaxial Braided Carbon/Epoxy Composites**

Bowman, C. L.; Roberts, G. D.; Braley, M. S.; Xie, M.; Booker, M. J.; [2003]; 7 pp.; In English; Materials and Processing: Enabling Flight...Our Legacy and Future, 28 Sep. - 2 Oct. 2003, Dayton, OH, USA

Contract(s)/Grant(s): 22-708-24-05; Copyright; Avail: CASI; [A02](#), Hardcopy

In an on-going effort to increase the safety and efficiency of turbine engines, the National Aeronautics and Space Administration is exploring lightweight alternatives to the metal containment structures that currently encase commercial jet engines. Epoxy reinforced with braided carbon fibers is a candidate structural material which may be suitable for an engine case. This paper reports flat-coupon mechanical-property experiments performed to compliment previously reported subcomponent impact testing and analytical simulation of containment structures. Triaxial-braid T700/5208 epoxy and triaxial-braid T700h436 toughened epoxy composites were evaluated. Also, two triaxial-braid architectures (0 degrees plus or

minus 60 degrees, and 0 degrees plus or minus 45 degrees) with the M36 resin were evaluated through tension, compression, and shear testing. Tensile behavior was compared between standard straight-sided specimens (ASTM D3039) and bow-tie specimens. Both double-notch shear (ASTM D3846) and Iosepescu (ASTM D5379) tests were performed as well. The M36/0 degrees plus or minus 45 degrees configuration yield the best response when measurements were made parallel to the axial tows. Conversely, the M36/0 degrees plus or minus 60 degrees configuration was best when measurements were made perpendicular to the axial tows. The results were used to identify critical properties and to augment the analysis of impact experiments.

#### **Nanocrystalline Chalcopyrite Materials (CuInS<sub>2</sub> and CuInSe<sub>2</sub>) via Low-Temperature Pyrolysis of Molecular Single-Source Precursors**

Castro, Stephanie L.; Bailey, Sheila G.; Raffaele, Ryne P.; Banger, Kulbinder K.; Hepp, Aloysius F.; March 18, 2003; 22 pp.; In English

Contract(s)/Grant(s): NCC3-958; NCC3-710; NCC3-563; WBS 22-755-60-03; Copyright; Avail: CASI; [A03](#), Hardcopy

Nanometer sized particles of the chalcopyrite compounds CuInS<sub>2</sub> and CuInSe<sub>2</sub> were synthesized by thermal decomposition of molecular single-source precursors (PPh<sub>3</sub>)<sub>2</sub>CuIn(SET)<sub>4</sub> and (PPh<sub>3</sub>)<sub>2</sub>CuIn(SePh)<sub>4</sub>, respectively, in the non-coordinating solvent dioctyl phthalate at temperatures between 200 and 300 C. The nanoparticles range in size from 3 - 30 nm and are aggregated to form roughly spherical clusters of about 500 nm in diameter. X-ray diffraction of the nanoparticle powders shows greatly broadened lines indicative of very small particle sizes, which is confirmed by TEM. Peaks present in the XRD can be indexed to reference patterns for the respective chalcopyrite compounds. Optical spectroscopy and elemental analysis by energy dispersive spectroscopy support the identification of the nanoparticles as chalcopyrites.

Contract(s)/Grant(s): NAG3-2644; 22-755-12-04; No Copyright; Avail: CASI; [A03](#), Hardcopy

Modifications in the vibrational properties of a single microparticle of LiMn<sub>2</sub>O<sub>4</sub> induced by extraction and subsequent injection of Li(+) into the lattice have been monitored in situ via simultaneous acquisition of Raman scattering spectra and cyclic voltammetry data in 1M LiClO<sub>4</sub> solutions in ethylene carbonate (EC):diethyl carbonate (DEC) mixtures (1:1 by volume). Statistical analyses of the spectra in the range 15 < SOD < 45%, where SOD represents the state of discharge (in percent) of the nominally fully charged material, i.e. lambda-MnO<sub>2</sub>, were found to be consistent with the coexistence of two distinct phases of lithiated metal oxide in agreement with information derived from in situ X-ray diffraction (XRD) measurements involving more conventional battery-type electrodes.

Liao, Liang; Pang, Yi; Ding, Liming; Karasz, Frank E.; Smith, Philip R.; Meador, Michael A.; [2003]; 26 pp.; In English

Contract(s)/Grant(s): 22-706-93-05; Copyright; Avail: CASI; [A03](#), Hardcopy

Soluble yellow/orange-emitting poly[tris(2,5-dihexyloxy-1,4-phenylenevinylene)-alt-(1,3-phenylenevinylene)]

derivatives (6) have been synthesized and characterized. These polymers contain oligo(p-phenylene vinylene) chromophores of equal conjugation length, which are linked to a m-phenylene unit. Optical comparison between 6 and its model compound 8 at room and low temperature reveals the similarity in their absorption and fluorescence band structures. The vibronic band structure of 6 is assigned with the aid of the spectroscopic data for 8 at low temperature. Polymers 6 are electroluminescent with emission  $\lambda_{\text{sub max}}$ , at approximately 565 nm. By using the device configuration of ITO/PEDOT/6/Ca, the polymer exhibits an external EL efficiency as high as 0.46%.

Many volatile metal hydroxides form by reaction of the corresponding metal oxide with water vapor. These reactions are important in a number of high temperature corrosion processes. Experimental methods for studying the thermodynamics of metal hydroxides include: gas leak Knudsen cell mass spectrometry, free jet sampling mass spectrometry, transpiration and hydrogen-oxygen flame studies. The available experimental information is reviewed and the most stable metal hydroxide species are correlated with position in the periodic table. Current studies in our laboratory on the Si-O-H system are discussed.

**In General, the Total Voltammetric Current from a Mixture of Redox-Active Substances will Not be the Sum of the Currents that Each Substance would Produce Independently at the Same Concentration as in the Mixture**

Leventis, Nicholas; Oh, Woon Su; Gao, Xue-Rong; Rawashdeh, Abdel Monem M.; April 23, 2003; 35 pp.; In English

Contract(s)/Grant(s): ACS-35154-AC5; 22-279-00-03-02; Copyright; Avail: CASI; [A03](#), Hardcopy

At the potential range where both decamethylferrocene (dMeFc) and ferrocene (Fc) are oxidized with rates controlled by linear diffusion, electrogenerated Fc(+) radicals diffusing outwards from the electrode react quantitatively ( $K_{23} C = 5.8 \times 10(\exp 8)$ ) with dMeFc diffusing towards the electrode and produce Fc and dMeFc. That reaction replaces dMeFc with Fc, whose diffusion coefficient is higher than that of dMeFc(+), and the total mass-transfer limited current from the mixture is increased by approximately 10%. Analogous observations are made when mass-transfer is controlled by convective-diffusion as in RDE voltammetry. Similar results have been obtained with another, and for all practical purposes randomly selected pair of redox-active substances, [Co(bipy)<sub>3</sub>](2+) and N - methylphenothiazine (MePTZ); reaction of MePTZ(+) with [Co(bipy)<sub>3</sub>](2+) replaces the latter with MePTZ, which diffuses faster and the current increases by approximately 20%. The experimental voltammograms have been simulated numerically and the role of (a) the rate constant of the homogeneous reaction; (b) the relative concentrations; and, (c) the diffusion coefficients of all species involved have been studied in detail. Importantly, it was also identified that within any given redox system the dependence of the mass-transfer limited current on the bulk concentrations of the redox-active species is expected to be non-linear. These findings are discussed in terms of their electroanalytical implications.

**Molecular Beam Epitaxy of Nitrides: Theoretical Modeling and Process Simulation**

Venkat, Rama; Mar. 2003; 74 pp.; In English

Contract(s)/Grant(s): F49620-99-1-0188; Proj-3484

Report No.(s): AD-A418076; AFRL-SR-AR-TR-03-0376; No Copyright; Avail: CASI; [A04](#), Hardcopy

A rate equation approach is proposed based on physically sound surface processes to investigate the molecular beam epitaxy growth and doping of 111-N using ammonia and ECR plasma source. A surface riding layer of Ga/In/Mg and ammonia or N plasma species are included in the model. The surface riding species are allowed to undergo several physical and chemical processes. In the case of ammonia, the simulated Ga incorporation rate as a function of ammonia pressure and substrate temperature are in excellent agreement with the experimental data. Ga incorporation increases with increasing ammonia overpressure. Simulated Ga desorption parameter versus time data is also in good qualitative agreement with the

experimental data. In the case of ECR plasma, electron concentration obtained from bulk vacancy concentrations of Ga and N decreases linearly with ECR power unlike the experimental observation of exponential decrease. In InGa<sub>N</sub> growth, results of In incorporation obtained from simulations and experiments are in excellent agreement for various growth conditions. In segregation is found to be negligible below 580 deg C. Above 640 deg C, the segregation dominates the kinetics. This temperature dependence is found to be independent of the fluxes. In MgGa<sub>N</sub> growth, simulations were carried for various growth temperatures in the range of 600-750 deg C. with constant flux rates of Mg, Ga and N. For the given flux rates, it is found that Mg segregates the surface with the increase in temperature. Above 750 deg C a dopant depleted zone is formed below the surface layer. Results obtained from simulations are in excellent agreement with the experimental data.

#### High Resolution, Single-Step Patterning of Silica Aerogels

Bertino, M. F.; Hund, J. F.; Sosa, J.; Zhang, G.; Sotiriou-Leventis, C.; Leventis, N.; Tokuhito, A. T.; Terry, J.; [2003]; 10 pp.; In English; Copyright; Avail: CASI; [A02](#), Hardcopy

Three-dimensional metallic structures are fabricated with high spatial resolution in silica aerogels. In our method, silica hydrogels are prepared with a standard base-catalyzed route, and exchanged with an aqueous solution typically containing Ag<sup>+</sup> ions (1 M) and 2-propanol (0.2 M). The metal ions are reduced photolytically with a table-top ultraviolet lamp, or radiolytically, with a focused X-ray beam. We fabricated dots and lines as small as 30 x 70 nm, protruding for several nm into the bulk of the materials. The hydrogels are eventually supercritically dried to yield aerogels, without any measurable change in the shape and spatial resolution of the lithographed structures. Transmission electron microscopy shows that illuminated regions are composed of Ag clusters with a size of several nm, separated by thin layers of silica.

#### Reduced Equations for Calculating the Combustion Rates of Jet-A and Methane Fuel

Molnar, Melissa; Marek, C. John; November 2003; 65 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): WBS 22-708-87-16

Report No.(s): NASA/TM-2003-212702; E-14205; NAS 1.15:212702; No Copyright; Avail: CASI; [A04](#), Hardcopy

Simplified kinetic schemes for Jet-A and methane fuels were developed to be used in numerical combustion codes, such as the National Combustor Code (NCC) that is being developed at Glenn. These kinetic schemes presented here result in a correlation that gives the chemical kinetic time as a function of initial overall cell fuel/air ratio, pressure, and temperature. The correlations would then be used with the turbulent mixing times to determine the limiting properties and progress of the reaction. A similar correlation was also developed using data from NASA's Chemical Equilibrium Applications (CEA) code to determine the equilibrium concentration of carbon monoxide as a function of fuel air ratio, pressure, and temperature. The NASA Glenn GLSENS kinetics code calculates the reaction rates and rate constants for each species in a kinetic scheme for finite kinetic rates. These reaction rates and the values obtained from the equilibrium correlations were then used to calculate the necessary chemical kinetic times. Chemical kinetic time equations for fuel, carbon monoxide, and NO<sub>x</sub> were obtained for both Jet-A fuel and methane.

Report No.(s): NASA/CR-2003-212618; E-14164; NAS 1.26:212618; No Copyright; Avail: CASI; [A03](#), Hardcopy

During the past decade, NASA has been a leading U.S. supporter of soft and complex condensed matter research. Experiments in space shuttles, MIR, the International Space Station (ISS), as well as ground-based research have provided new insights into several areas including hard sphere colloids, crystal growth, phase ordering, and transport of complex fluids at the critical point. To help define the next generation of flight experiments needed to answer remaining important questions in the field of soft and complex condensed matter, NASA's Office of Biological and Physical Science sponsored a workshop on Soft and Complex Condensed Matter, March 6, 2003. This workshop asked leading members in the field of Soft and Complex Condensed Matter (at the APS March Meeting) to help identify exciting unanswered questions in the field, along with specific research topics for which the absence of gravity would enable significant results unobtainable by other means. The workshop was attended by 24 participants from universities across the U.S. and from five different countries (in addition to NASA GRC participants).

### **Maximizing the Stability of an Ensemble of Clocks**

Ruiz, Juan J.; Sep. 2003; 103 pp.; In English; Original contains color illustrations

Report No.(s): AD-A418283; No Copyright; Avail: CASI; [A06](#), Hardcopy

Atomic Clocks provide 'stable' signals that are mainly used to generate time scales and to measure differences of time between events. Each atomic clock can individually be characterized according to the stability of the scale it produces. Due to the stochastic behavior of each clock, usually clock ensembles are used to build more stable time scales. This process requires basically two steps. First it is required to individually characterize each time source to identify the particular noise components present. Second, a measure of performance is required in order to derive an algorithm based on it to properly 'weigh' this particular clock in the process of creating a combined scale. In this thesis both problems are faced using an operations research approach: each clock is modeled, analyzed and characterized by a time-dependent measure of performance related to its intrinsic stability, and optimally combined to produce a more stable combined time scale. The optimality criterion is directly related to the spectral characteristics of the noise sources present.

**The Significance of Genetic Representation in Genetic Antenna Design**

ODonnell, Terry H.; Altshuler, Edward E.; Best, Steven R.; Jan. 2003; 4 pp.; In English

Report No.(s): AD-A418160; No Copyright; Avail: CASI; [A01](#), Hardcopy

Genetic algorithms have been shown to be effective in the design of small antennas. However, their effectiveness depends on both the mechanisms of the genetic algorithm and the genetic representation of the problem. Here we present three genetic chromosome representations for a small antenna design problem (lowest VSWR for a specified  $h/\lambda$  cube size) and compare the results of the three optimization processes. Our work shows that different chromosome representations lead to solutions in different, overlapping subclasses, and that an important consideration in genetic antenna design is finding a simple chromosome representation which is capable of representing the subclass containing the 'optimal' solution. Our initial results show that the chromosome design itself is an important factor in successful genetic antenna design.

Contract(s)/Grant(s): WBS 22-322-20-04

Report No.(s): NASA/TM-2003-212602; E-14160; Copyright; Avail: CASI; [A03](#), Hardcopy

Ideal phased array antennas offer advantages for communication systems, such as wide-angle scanning and multibeam operation, which can be utilized in certain NASA applications. However, physically realizable, electronically steered, phased array antennas introduce additional system performance parameters, which must be included in the evaluation of the system. The NASA Glenn Research Center (GRC) is currently conducting research to identify these parameters and to develop the tools necessary to measure them. One of these tools is a testbed where phased array antennas may be operated in an environment that simulates their use. This paper describes the development of the testbed and its use in characterizing a particular K-Band, phased array antenna.

**Ruggedized Full-Color Flexible OLED Display**

Hack, Michael; Forrest, Stephen R.; Thompson, Mark; Jackson, Tom; Praino, Robert; Jun. 2003; 70 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): MDA972-00-C-0017; Proj-H731

Report No.(s): AD-A418358; AFRL-HE-WP-TR-2003-0092; No Copyright; Avail: CASI; [A04](#), Hardcopy

The objective of this program was to demonstrate a flexible, rugged, bright and efficient phosphorescent OLED technology with a low cost manufacturing path. The team comprised Universal Display Corporation, Princeton University, the University of Southern California, Penn State University, L3 Displays and Vitex Systems, and was led by Universal Display Corporation (PI: Michael Hack). The program focused on developing the technology to enable reliable low power consumption flexible (FOLED(Trademark)) displays to be fabricated on plastic substrates. This involved the integration of phosphorescent OLEDs (PHOLED(Trademark)) with multi-layer permeation barriers deposited over the substrate and also as a thin film encapsulant over the OLED to prevent degradation by oxygen or moisture. Additional tasks were development of large area, low cost organic vapor phase deposition (OVPD(Trademark)) fabrication technology, along with novel approaches to demonstrating bistable OLED pixels for advanced displays with reduced information bandwidth requirements. Accomplishments included the demonstration of thin film encapsulated OLED pixels on plastic substrates with lifetimes exceeding 2,000 hours, the delivery to the government of monochrome, phosphorescent OLED passive-matrix displays on plastic substrates, high performance OLEDs and TFTs grown using OVPD, and bistable OLED pixels fabricated from both

a novel integrated organic OLED (TOLED(Trademark)) integrated with an organic photodetector, as well as a second approach utilizing OLEDs and amorphous silicon TFTs.

**Water Tunnel Downstream Array (ARL No. 02-16) Design and Test Report**

Allen, C. W.; Myer, E. C.; Kline, B. L.; Oct. 27, 2003; 42 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): N00014-01-1-0311

Report No.(s): AD-A418375; No Copyright; Avail: CASI; [A03](#), Hardcopy

A four-ring, broadband receiver array was designed, fabricated, and tested by the Applied Research Laboratory at Pennsylvania State University to replace the existing downstream array in the large diameter water tunnel. The new array (ARL no. 02-16) provides a substantially larger frequency-operating band (0.5 to 200 kHz) than the previous array. The array is fabricated from 1-3 composite materials and has four separate ring channels and a sum (all four rings) channel, which, along with the preamplifier, incorporates amplitude shading to provide low sidelobe levels (typically less than -30 dB). The array and preamplifier exhibit low noise levels that are less than 20 dB re: micron Pa/ Hz(sup 1/2) for the sum channel over the majority of the operating band. This material is based upon work supported by the Office of Naval Research through the Naval Sea Systems Command under Grant No. N00014-01-1-0311, Instrumentation and Equipment Upgrades to Improve Acoustical and Fluid Dynamic Measurements in the Garfield Thomas Water Tunnel.

**Progress in GaAs Metamorphic HEMT Technology for Microwave Applications. High Efficiency Ka-Band MHEMT Power MMICs**

Smith, P. M.; Dugas, D.; Chu, K.; Nichols, K.; Duh, K. H.; Fisher, J.; MtPleasant, L.; Xu, D.; Gunter, L.; Vera, A., et al.; [2003]; 4 pp.; In English; IEEE GaAs IC Symposium, 10 Nov. 2003, San Diego, CA, USA

Contract(s)/Grant(s): NAS3-01090; DAAD19-01-C-0068; Copyright; Avail: CASI; [A01](#), Hardcopy

This paper reviews recent progress in the development of GaAs metamorphic HEMT (MHEMT) technology for microwave applications. Commercialization has begun, while efforts to further improve performance, manufacturability and reliability continue. We also report the first multi-watt MHEMT MMIC power amplifiers, demonstrating up to 3.2W output power and record power-added efficiency (PAE) at Ka-band.

**Monolithic Interconnected Modules (MIMs) for Thermophotovoltaic Energy Conversion**

Wilt, David; Wehrer, Rebecca; Palmisiano, Marc; Wanlass, Mark; Murray, Christopher; [2003]; 20 pp.; In English; No Copyright; Avail: CASI; [A03](#), Hardcopy

Monolithic Interconnected Modules (MIM) are under development for thermophotovoltaic (TPV) energy conversion applications. MIM devices are typified by series-interconnected photovoltaic cells on a common, semi-insulating substrate and generally include rear-surface infrared (IR) reflectors. The MIM architecture is being implemented in InGaAsSb materials without semi-insulating substrates through the development of alternative isolation methodologies. Motivations for developing the MIM structure include: reduced resistive losses, higher output power density than for systems utilizing front surface spectral control, improved thermal coupling and ultimately higher system efficiency. Numerous design and material changes have been investigated since the introduction of the MIM concept in 1994. These developments as well as the current design strategies are addressed.

**In-Situ, Time-Resolved Raman Spectro-micro-topography of an Operating Lithium Ion Battery**

Luo, Yu; Cai, Wen-Bin; Xing, Xue-Kun; Scherson, Daniel A.; March 2003; 19 pp.; In English

Contract(s)/Grant(s): NAG3-2644; 22-755-12-04; No Copyright; Avail: CASI; [A03](#), Hardcopy

A Raman microscope has been coupled to a computer-controlled, two-dimensional linear translator attached to a custom-designed, sealed optical chamber to allow in situ acquisition of space-, and time-resolved spectra of an operating thin graphite/LiCoO<sub>2</sub> Li-ion battery. This unique arrangement made it possible to collect continuously series of Raman spectra from a sharply defined edge of the battery exposing the anode (A), separator (S), and cathode (C), during charge and discharge, while the device was moved back and forth under the fixed focused laser beam along an axis normal to the layered A/S/C plane. Clear spectral evidence was obtained for changes in the amount of Li(+) within particles of graphite in the anode, and, to a lesser extent, of LiCoO<sub>2</sub> in the cathode, during battery discharge both as a function of position and time. Analysis of time-resolved Raman spectro-micro-topography (SMT) measurements of the type described in this work are expected to open new prospects for assessing the validity of theoretical models aimed at simulating the flow of Li(+) within Li-ion batteries under operating conditions.

#### **Investigation of the Flow Physics Driving Stall-Side Flutter in Advanced Forward Swept Fan Designs**

Sanders, Albert J.; Liu, Jong S.; Panovsky, Josef; Bakhle, Milind A.; Stefko, George; Srivastava, Rakesh; [2003]; 7 pp.; In English; Tenth International Symposium on Unsteady Aerodynamics, Aeroacoustics and Aeroelasticity of Turbomachines (10th ISUAAAT), 7-11 Sep. 2003, Durham, NC, USA; Copyright; Avail: CASI; [A02](#), Hardcopy

Flutter-free operation of advanced transonic fan designs continues to be a challenging task for the designers of aircraft engines. In order to meet the demands of increased performance and lighter weight, these modern fan designs usually feature low-aspect ratio shroudless rotor blade designs that make the task of achieving adequate flutter margin even more challenging for the aeroelastician. This is especially true for advanced forward swept designs that encompass an entirely new design space compared to previous experience. Fortunately, advances in unsteady computational fluid dynamic (CFD) techniques over the past decade now provide an analysis capability that can be used to quantitatively assess the aeroelastic characteristics of these next generation fans during the design cycle. For aeroelastic applications, Mississippi State University and NASA Glenn Research Center have developed the CFD code TURBO-AE. This code is a time-accurate three-dimensional Euler/Navier-Stokes unsteady flow solver developed for axial-flow turbomachinery that can model multiple blade rows undergoing harmonic oscillations with arbitrary interblade phase angles, i.e., nodal diameter patterns. Details of the code can be found in Chen et al. (1993, 1994), Bakhle et al. (1997, 1998), and Srivastava et al. (1999). To assess aeroelastic stability, the work-per-cycle from TURBO-AE is converted to the critical damping ratio since this value is more physically meaningful, with both the unsteady normal pressure and viscous shear forces included in the work-per-cycle calculation. If the total damping (aerodynamic plus mechanical) is negative, then the blade is unstable since it extracts energy from the flow field over the vibration cycle. TURBO-AE is an integral part of an aeroelastic design system being developed at Honeywell Engines, Systems & Services for flutter and forced response predictions, with test cases from development rig and engine tests being used to validate its predictive capability. A recent experimental program (Sanders et al., 2002) was aimed at providing the necessary unsteady aerodynamic and vibratory response data needed to validate TURBO-AE for fan flutter predictions. A comparison of numerical TURBO-AE simulations with the benchmark flutter data is given in Sanders et al. (2003), with the data used to guide the validation of the code and define best practices for performing accurate unsteady simulations. The agreement between the analyses and the predictions was quite remarkable, demonstrating the ability of the analysis to accurately model the unsteady flow processes driving stall-side flutter.

#### **Thermodynamic Modeling of the YO(l.5)-ZrO<sub>2</sub> System**

Jacobson, Nathan S.; Liu, Zi-Kui; Kaufman, Larry; Zhang, Fan; [2003]; 30 pp.; In English; HTMC-XI, 18-24 May 2003, Tokyo, Japan

Contract(s)/Grant(s): 22-708-31-22; Copyright; Avail: CASI; [A03](#), Hardcopy

The YO<sub>1.5</sub>-ZrO<sub>2</sub> system consists of five solid solutions, one liquid solution, and one intermediate compound. A thermodynamic description of this system is developed, which allows calculation of the phase diagram and thermodynamic properties. Two different solution models are used—a neutral species model with YO<sub>1.5</sub> and ZrO<sub>2</sub> as the components and a charged species model with Y(+3), Zr(+4), O(-2), and vacancies as components. For each model, regular and sub-regular solution parameters are derived from selected equilibrium phase and thermodynamic data.

**Performance and Flow Regimes in Plane 2-D Diffusers With Exit Channels at Low Reynolds Numbers**

Trivilos, Epameinondas; Sep. 2003; 99 pp.; In English; Original contains color illustrations

Report No.(s): AD-A418272; No Copyright; Avail: CASI; [A05](#), Hardcopy

A numerical study on laminar incompressible flows in 2-D straight walled diffusers in the low Reynolds number regime (105-1048) is presented to investigate performance and various flow regimes that might exist. Tail channels are situated downstream the diffusers. Geometries with area ratios AR=1.15 to 5 and non-dimensional lengths of L/W<sub>1</sub>=1 to 48 are considered. Results are presented in terms of flow regime maps for Reynolds numbers of 105, 210, 314, 420, 629, 1,048 and pressure recovery coefficients maps for Re numbers of 105, 210, 314, 420 and 629. In addition time resolved simulations of impulsively starting flow are considered at Re=210, 314 for 12 geometries on the flow regime map. Four flow regimes can be distinguished depending on diffuser geometry. With increasing divergence angle the flow goes from attached to symmetrically separated to asymmetrically separated and finally to a non 2-D pattern respectively.

**Using CFD as Rocket Injector Design Tool: Recent Progress at Marshall Space Flight Center**

Tucker, Kevin; West, Jeff; Williams, Robert; Lin, Jeff; Rucker, Marvin; Canabal, Francisco; Robles, Bryan; Garcia, Robert; Chenoweth, James; [2003]; 43 pp.; In English; 5th International Symposium on Liquid Space Propulsion Long Life Combustion Devices Technology, 27-30 Oct. 2003, Chattanooga, TN, USA; Copyright; Avail: CASI; [A03](#), Hardcopy

The choice of tools used for injector design is in a transitional phase between exclusive reliance on the empirically based correlations and extensive use of computational fluid dynamics (CFD). The Next Generation Launch Technology (NGLT) Program goals emphasizing lower costs and increased reliability have produced a need to enable CFD as an injector design tool in a shorter time frame. This is the primary objective of the Staged Combustor Injector Technology Task currently under way at Marshall Space Flight Center (MSFC). The documentation of this effort begins with a very brief status of current injector design tools. MSFC's vision for use of CFD as a tool for combustion devices design is stated and discussed with emphasis on the injector. The concept of the Simulation Readiness Level (SRL), comprised of solution fidelity, robustness and accuracy, is introduced and discussed. This quantitative measurement is used to establish the gap between the current state of demonstrated capability and that necessary for regular use in the design process. MSFC's view of the validation process is presented and issues associated with obtaining the necessary data are noted and discussed. Three current experimental efforts aimed at generating validation data are presented. The importance of uncertainty analysis to understand the data quality is also demonstrated. First, a brief status of current injector design tools is provided as context for the current effort. Next, the MSFC vision for using CFD as an injector design tool is stated. A generic CFD-based injector design methodology is also outlined.

and briefly discussed. Three areas where MSFC is using injector CFD analyses for program support will be discussed. These include the Integrated Powerhead Development (IPD) engine which uses hydrogen and oxygen propellants in a full flow staged combustion (FFSC) cycle and the TR-107 and the RS84 engine both of which use RP-1 and oxygen in an ORSC cycle. Finally, an attempt is made to objectively summarize what progress has been made at MSFC in enabling CFD as an injector design tool.

#### **Resonant Spectra of Malignant Breast Cancer Tumors Using the Three-Dimensional Electromagnetic Fast Multipole Model, Part 1**

El-Shenawee, Magda; [2003]; 55 pp.; In English

Contract(s)/Grant(s): NAG1-020; NSF EEC-99-86821; No Copyright; Avail: CASI; [A04](#), Hardcopy

An intensive numerical study for the resonance scattering of malignant breast cancer tumors is presented. The rigorous three-dimensional electromagnetic model, based on the equivalence theorem, is used to obtain the induced electric and magnetic currents on the breast and tumor surfaces. The results show that a non-spherical malignant tumor can be characterized based its spectra regardless of its orientation, the incident polarization, or the incident or scattered directions. The tumor's spectra depend solely on its physical characteristics (i.e., the shape and the electrical properties), however, their locations are not functions of its burial depth. This work provides a useful guidance to select the appropriate frequency range for the tumor's size.

#### **Assimilation of Satellite Ozone Observations**

Stajner, I.; Winslow, N.; Wargan, K.; Hayashi, H.; Pawson, S.; Rood, R.; [2003]; 1 pp.; In English; EGS-AGU-EUG Joint Assembly, 6-11 Apr. 2003, Nice, France; No Copyright; Avail: Other Sources; Abstract Only

This talk will discuss assimilation of ozone data from satellite-borne instruments. Satellite observations of ozone total columns and profiles have been measured by a series of Total Ozone Mapping Spectrometer (TOMS), Solar Backscatter Ultraviolet (SBUV) instruments, and more recently by the Global Ozone Monitoring Experiment. Additional profile data are provided by instruments on NASA's Upper Atmosphere Research Satellite and by occultation instruments on other platforms. Instruments on Envisat' and future EOS Aura satellite will supply even more comprehensive data about the ozone distribution. Satellite data contain a wealth of information, but they do not provide synoptic global maps of ozone fields. These maps can be obtained through assimilation of satellite data into global chemistry and transport models. In the ozone system at NASA's Data Assimilation Office (DAO) any combination of TOMS, SBUV, and Microwave Limb sounder (MLS) data can be assimilated. We found that the addition of MLS to SBUV and TOMS data in the system helps to constrain the ozone distribution, especially in the polar night region and in the tropics. The assimilated ozone distribution in the troposphere and lower stratosphere is sensitive also to finer changes in the SBUV and TOMS data selection and to changes in error covariance models. All results are established by comparisons of assimilated ozone with independent profiles from ozone sondes and occultation instruments.

#### **GOME Total Ozone and Calibration Error Derived Using Version 8 TOMS Algorithm**

Gleason, J.; Wellemeyer, C.; Qin, W.; Ahn, C.; Gopalan, A.; Bhartia, P.; [2003]; 1 pp.; In English; EGS-AGU-EUG Joint Assembly 2003, 7-11 Apr. 2003, Nice, France; No Copyright; Avail: Other Sources; Abstract Only

The Global Ozone Monitoring Experiment (GOME) is a hyper-spectral satellite instrument measuring the ultraviolet backscatter at relatively high spectral resolution. GOME radiances have been slit averaged to emulate measurements of the Total Ozone Mapping Spectrometer (TOMS) made at discrete wavelengths and processed using the new TOMS Version 8 Ozone Algorithm. Compared to Differential Optical Absorption Spectroscopy (DOAS) techniques based on local structure in the Huggins Bands, the TOMS uses differential absorption between a pair of wavelengths including the local structure as well as the background continuum. This makes the TOMS Algorithm more sensitive to ozone, but it also makes the algorithm more sensitive to instrument calibration errors. While calibration adjustments are not needed for the fitting techniques like the DOAS employed in GOME algorithms, some adjustment is necessary when applying the TOMS Algorithm to GOME. Using spectral discrimination at near ultraviolet wavelength channels unabsorbed by ozone, the GOME wavelength dependent calibration drift is estimated and then checked using pair justification. In addition, the day one calibration offset is estimated based on the residuals of the Version 8 TOMS Algorithm. The estimated drift in the 2b detector of GOME is small through the first four years and then increases rapidly to +5% in normalized radiance at 331 nm relative to 385 nm by mid 2000. The 1b detector appears to be quite well behaved throughout this time period.

#### **New Total Ozone Algorithm for Application to the Total Ozone Mapping Spectrometer**

Wellemeyer, C.; Bhartia, P. K.; Taylor, S. L.; Qin, W.; Flynn, L.; Seftor, C.; [2003]; 1 pp.; In English; EGS-AGU-EUG Joint Assembly 2003, 7-11 Apr. 2003, Nice, France; No Copyright; Avail: Other Sources; Abstract Only

The Total Ozone Mapping Spectrometer (TOMS) series comprises four instruments providing a total of 25 years of daily global stratospheric ozone data over the sunlit portion of the Earth. A new retrieval algorithm has been developed for TOMS, designated Version 8. The algorithm is based on differential absorption across a pair of wavelength channels chosen close together to minimize the impact of wavelength dependent forward modeling errors. Version 8 enhancements include correction for the presence of tropospheric aerosols and sun glint from water surfaces, a better treatment of variability due to tropospheric ozone and temperature dependence, and an improved forward model, particularly in regions of persistent snow and ice. Among other things, the Version 8 enhancements have reduced latitudinal dependence seen previously in TOMS - Dobson comparisons, predominantly in the Southern Hemisphere's summer, when the tropospheric ozone, temperature, and snow/ice corrections are additive. The basic components of the algorithm and its impact on derived total ozone will be discussed.

#### **EOS-Aura's Ozone Monitoring Instrument (OMI): Validation Requirements**

Brinksma, E. J.; McPeters, R.; deHaan, J. F.; Levelt, P. F.; Hilsenrath, E.; Bhartia, P. K.; [2003]; 1 pp.; In English; EGS-AGU-EUG Joint Assembly 2003, 7-11 Apr. 2003, Nice, France; Copyright; Avail: Other Sources; Abstract Only

OMI is an advanced hyperspectral instrument that measures backscattered radiation in the UV and visible. It will be flown as part of the EOS Aura mission and provide data on atmospheric chemistry that is highly synergistic with other Aura instruments HIRDLS, MLS, and TES. OMI is designed to measure total ozone, aerosols, cloud information, and UV irradiances, continuing the TOMS series of global mapped products but with higher spatial resolution. In addition its hyperspectral capability enables measurements of trace gases such as SO<sub>2</sub>, NO<sub>2</sub>, HCHO, BrO, and OClO. A plan for validation of the various OMI products is now being formulated. Validation of the total column and UVB products will rely heavily on existing networks of instruments, like NDSC. NASA and its European partners are planning aircraft missions for the validation of Aura instruments. New instruments and techniques (DOAS systems for example) will need to be developed, both ground and aircraft based. Lidar systems are needed for validation of the vertical distributions of ozone, aerosols, NO<sub>2</sub> and possibly SO<sub>2</sub>. The validation emphasis will be on the retrieval of these products under polluted conditions. This is challenging because they often depend on the tropospheric profiles of the product in question, and because of large spatial variations in the troposphere. Most existing ground stations are located in, and equipped for, pristine environments. This is also true for almost all NDSC stations. OMI validation will need ground based sites in polluted environments and specially developed instruments, complementing the existing instrumentation.

**Optomechanical Alignment of the Grating Wheel Mechanism for a Ground-based, Cryogenic, Near-Infrared Astronomy Instrument**

Gutkowski, Sharon M.; Ohl, Raymond G.; Hagopian, John G.; Kraft, Stephen E.; Mentzell, J. Eric; Schepis, Joseph P.; Sparr, Leroy M.; Greenhouse, Matthew A.; Hyland, Jason; Mackenty, John W.; [2003]; 1 pp.; In English; SPIE-Optical Science and Technology Annual Meeting, 3-8 Aug. 2003, San Diego, CA, USA; No Copyright; Avail: Other Sources; Abstract Only

We describe the population, optomechanical alignment, and alignment verification of near-infrared gratings on the grating wheel mechanism (GWM) for the Infrared Multi- Object Spectrometer (IRMOS). IRMOS is a cryogenic (80 K) facility instrument for the Mayall Telescope (3.8 m) at Kitt Peak National Observatory and a MEMS spectrometer concept demonstrator for NASA's James Webb Space Telescope. The IRMOS optics, bench, and mechanisms are predominantly made of Al 6061 -T651. The GWM consists of 13 planar diffraction gratings and one flat imaging mirror (58 x 57 mm), each mounted at a unique compound angle on a 31.8 cm diameter gear. The Al 6061 grating substrates are stress relieved for enhanced cryogenic performance and the optical surface is replicated from an off-the-shelf master. The imaging mirror is diamond turned and post-polished. The grating mechanism spans a projected diameter of approximately 48cm when fully assembled, utilizes several flexure designs throughout the system to accommodate thermal gradient situations, and is controlled using custom software with an off-the-shelf controller. Each optic is aligned in six degrees of freedom relative to the GWM coordinate system, which is defined relative to an optical alignment cube mounted at the center of the gear. The tip/tilt (Rx, Ry) orientation of a given grating is measured using the zero-order return from an autocollimating theodolite. Each optic's mount includes a one-piece shim located between the optic and the gear. The shim is machined to fine align each optic. We also describe alignment verification, where grating diffractive properties are compared to model predictions.

**Ambient and Cryogenic Alignment Verification and Performance of the Infrared Multi-Object Spectrometer**

Connelly, Joseph A.; Ohl, Raymond G.; Mink, Ronald G.; Mentzell, J. Eric; Saha, Timo T.; Tveekrem, June L.; Hylan, Jason E.; Sparr, Leroy M.; Chambers, V. John; Hagopian, John G., et al.; [2003]; 1 pp.; In English; SPIE-Optical Science and Technology Annual Meeting, 3-8 Aug. 2003, San Diego, CA, USA; No Copyright; Avail: Other Sources; Abstract Only

The Infrared Multi-Object Spectrometer (IRMOS) is a facility instrument for the Kitt Peak National Observatory 4 and 2.1 meter telescopes. IRMOS is a near-IR (0.8 - 2.5 micron) spectrometer with low- to mid-resolving power ( $R = 300 - 3000$ ). IRMOS produces simultaneous spectra of approximately 100 objects in its  $2.8 \times 2.0$  arc-min field of view using a commercial Micro Electro-Mechanical Systems (MEMS) Digital Micro-mirror Device (DMD) from Texas Instruments. The IRMOS optical design consists of two imaging subsystems. The focal reducer images the focal plane of the telescope onto the DMD field stop, and the spectrograph images the DMD onto the detector. We describe ambient breadboard subsystem alignment and imaging performance of each stage independently, and the ambient and cryogenic imaging performance of the fully assembled instrument. Interferometric measurements of subsystem wavefront error serve to verify alignment, and are accomplished using a commercial, modified Twyman-Green laser unequal path interferometer. Image testing provides further verification of the optomechanical alignment method and a measurement of near-angle scattered light due to mirror small-scale surface error. Image testing is performed at multiple field points. A mercury-argon pencil lamp provides spectral lines at 546.1 nm and 1550 nm, and a CCD camera and IR camera are used as detectors. We use commercial optical modeling software to predict the point-spread function and its effect on instrument slit transmission and resolution. Our breadboard test results validate this prediction. We conclude with an instrument performance prediction for first light.

**Design and Performance Tests of Ultra-Compact Calorimeters for High Energy Astrophysics**

Salgado, Carlos W.; [2003]; 37 pp.; In English

Contract(s)/Grant(s): NAG5-8653; No Copyright; Avail: CASI; [A03](#), Hardcopy

This R&D project had two goals: a) the study of general-application ultra-compact calorimetry technologies for use in High Energy Astrophysics and, b) contribute to the design of an efficient calorimeter for the ACCESS mission. The direct measurement of galactic cosmic ray fluxes is performed from space or from balloon-borne detectors. Detectors used in those studies are limited in size and, specially, in weight. Since galactic cosmic ray fluxes are very small, detectors with high geometrical acceptances and long exposures are usually required for collecting enough statistics. We have studied calorimeter

techniques that could produce large geometrical acceptance per unit of mass (G/w) and that may be used to study galactic cosmic rays at intermediate energies (knee energies).-The most important asset for detection of primary cosmic rays at and about the knee is large acceptance. To construct a large acceptance calorimeter (this term is used here in its most general accepted meaning of calorimeter as a device to measure particle energies ) the detector needs to be very light or very shallow . We studied two possible technologies to build compact calorimeters: the use of lead-tungstate crystals (PWO) and the use of sampling calorimetry using scintillating fibers embedded in a matrix of powder tungsten. For a very light detector, we considered the possibility of using Optical Transition Radiation (OTR) to measure the energy (and perhaps also direction and identity) of VHE cosmic rays.

**Target Position and Trajectory Measurements by Videogrammetry**

Hobbs, Stephen; November 2003; 70 pp.; In English

Report No.(s): COA-0208; Copyright; Avail: Other Sources

This report documents the algorithms, data processing and software for the video photogrammetry (videogrammetry) system developed at Cranfield University. Cranfield's system has been used successfully since 1999 on a range of measurement projects. Videogrammetry typically uses two video cameras to film the motion of target objects in stereo, and then with suitable image processing and data analysis the targets 3d trajectories are measured to good precision. The main features of the Cranfield systems are that it is based on consumer electronics devices (e.g. digital camcorders and PC's), and that it is designed as an experimental tool. Using consumer electronics provides good performance at low cost. Its experimental character means that an expert user is required, but does allow great flexibility. Current system performance derives from the image resolution of 1 mrad per pixel over a field of view 720 by 576 pixels, and a frame rate of 25 Hz. Two areas of work are described: (1) the mathematical models and algorithms used for calibration, position measurement and trajectory extraction, and (2) the software tools written to manipulate images and process the data. The model of the imaging system can be adapted for a wide range of applications, and is explicitly developed in this report for a single camera position and pose calibration, a two-camera system calibration, and a measurement system using two or more cameras (either the general non-linear case or a linear approximation). The image calibration (which converts image coordinates to geometrical angles of inclination and azimuth) is based on a 3rd order polynomial and achieves an accuracy equivalent to better than 1 pixel. Trajectories are obtained by either labelling targets or using kinematic rules. Two programs (AVI1 and mftvid) have been written for the videogrammetry system and are described in outline (for a user and to support future development). Commercial software provides the more general functions required by the system. Experience with the videogrammetry system over a number of years gives confidence in its performance. Example results are provided to illustrate the type of measurements which are possible.

**Development of Nonlinear Optical Materials (LBO, BBO, and KTP) for Use in High-Power Lasers**

Halliburton, Larry E.; Giles, Nancy C.; Oct. 15, 2003; 12 pp.; In English

Contract(s)/Grant(s): F49620-99-1-0301

Report No.(s): AD-A418265; AFRL-SR-AR-TR-03-0458; No Copyright; Avail: CASI; [A03](#), Hardcopy

This is the final technical report for a three- year project to identify and characterize point defects in single crystals of LiB(3)O(5) (LBO), Beta-BaB(2) O(4) (BBO), KTiOPO(4) (KTP), KH(2)PO(4), and ZnO. These materials are used to generate ultraviolet laser beams, and their performance is often limited by the presence of optically active point defects. In this project, we have investigated a variety of electron and hole traps and have shown how they affect the behavior of devices. The experimental techniques used to characterize the crystals were optical absorption, visible photoluminescence, electron

paramagnetic resonance (EPR), photoinduced EPR, and electron-nuclear double resonance (ENDOR). Industrial collaborators included Northrop Grumman (formerly Litton Airtron Synoptics), Lightwave Electronics, Crystal Associates, Cleveland Crystals, and Crystal Laser. Specific results during this project include: (1) a detailed characterization of Ti(3+) centers in KTP, (2) identification of self-trapped hole centers in LBO and BBO crystals, (3) identification of oxygen vacancies as the primary electron trap in LBO, BBO, and KH(2)PO(4) crystals, (4) production of neutral isolated nitrogen acceptors in ZnO crystals, and (5) observation of Ag(0) atoms and Ag(2+) ions after diffusion of silver into BBO crystals.

#### **Load Diffusion in Composite and Smart Structures**

Horgan, C. O.; [2003]; 9 pp.; In English

Contract(s)/Grant(s): NCC1-02019; No Copyright; Avail: CASI; [A02](#), Hardcopy

The research carried out here builds on our previous NASA supported research on the general topic of edge effects and load diffusion in composite structures. Further fundamental solid mechanics studies were carried out to provide a basis for assessing the complicated modeling necessary for the multi-functional large scale structures used by NASA. An understanding of the fundamental mechanisms of load diffusion in composite subcomponents is essential in developing primary composite structures. Some specific problems recently considered were those of end effects in smart materials and structures, study of the stress response of pressurized linear piezoelectric cylinders for both static and steady rotating configurations, an analysis of the effect of pre-stressing and pre-polarization on the decay of end effects in piezoelectric solids and investigation of constitutive models for hardening rubber-like materials. Our goal in the study of load diffusion is the development of readily applicable results for the decay lengths in terms of non-dimensional material and geometric parameters. Analytical models of load diffusion behavior are extremely valuable in building an intuitive base for developing refined modeling strategies and assessing results from finite element analyses. The decay behavior of stresses and other field quantities provides a significant aid towards this process. The analysis is also amenable to parameter study with a large parameter space and should be useful in structural tailoring studies. Special purpose analytical models of load diffusion behavior are extremely valuable in building an intuitive base for developing refined modeling strategies and in assessing results from general purpose finite element analyses. For example, a rational basis is needed in choosing where to use three-dimensional to two-dimensional transition finite elements in analyzing stiffened plates and shells. The decay behavior of stresses and other field quantities furnished by this research provides a significant aid towards this element transition issue. A priori knowledge of the extent of boundary-layers induced by edge effects is also useful in determination of the instrumentation location in structural verification tests or in material characterization tests.

### **Compendium of NASA Data Base for the Global Tropospheric Experiment's Transport and Chemical Evolution Over the Pacific (TRACE-P), Volume 1, DC-8**

Kleb, Mary M.; Scott, A. Donald, Jr.; October 2003; 546 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): WU 622-63-06-70

Report No.(s): NASA/TM-2003-212429/VOL1; L-18260A/VOL1; No Copyright; Avail: CASI; [A23](#), Hardcopy

This report provides a compendium of NASA aircraft data that are available from NASA's Global Tropospheric Experiment's (GTE) Transport and Chemical Evolution over the Pacific (TRACE-P) Mission. The broad goal of TRACE-P was to characterize the transit and evolution of the Asian outflow over the western Pacific. Conducted from February 24 through April 10, 2001, TRACE-P integrated airborne, satellite- and ground-based observations, as well as forecasts from aerosol and chemistry models. The format of this compendium utilizes data plots (time series) of selected data acquired aboard the NASA/Dryden DC-8 (vol. 1) and NASA/Wallops P-3B (vol. 2) aircraft during TRACE-P. The purpose of this document is to provide a representation of aircraft data that are available in archived format via NASA Langley's Distributed Active Archive Center (DAAC) and through the GTE Project Office archive. The data format is not intended to support original research/analyses, but to assist the reader in identifying data that are of interest.

**Satellite Interferometric Observations of Displacements Associated with Seasonal Groundwater in the Los Angeles Basin**

Watson, Karen M.; Bock, Yehuda; Sandwell, David T.; Journal of Geophysical Research; 2002; ISSN 0148-0227; Volume 107, No. B4, pp. 1-18; In English

Contract(s)/Grant(s): NAS5-9623; NSF-EAR-9619201; NSF-EAR-8920136; USGS-14-08-0001; USGS-1432-HQ97AG01718; SCEC-623; Copyright; Avail: Other Sources

The Newport-Inglewood fault zone (NIFZ) displays interferometric synthetic aperture radar (SAR) phase features along most of its length having amplitudes of up to 60 mm. However, interpretation in terms of right-lateral, shallow slip along the fault fails to match the range of geologic estimates of slip. Recently, Bawden et al. proposed that these phase features, as well as a broader deformation pattern in the Los Angeles basin, are due to vertical motion related to annual variations in the elevation of the water table. We confirm this hypothesis through the analysis of a longer span of data consisting of 26 SAR images collected by the ERS-1 and ERS-2 spacecraft between June 1992 and June 2000. Moreover, we use continuous GPS measurements from 1995 to the present to establish the amplitude and phase of the vertical deformation. The Los Angeles basin becomes most inflated one quarter of the way through the year, which is consistent with water table measurements as well as with the end of the rainy season when the aquifer should be at a maximum. The spatial pattern of the amplitude of the annual signal derived from continuous GPS measurements is consistent with the shape of the interferometric fringes. GPS sites both near the NIFZ and in a 20 by 40 km zone within the basin also show significant N-S annual variations that may be related to the differential expansion across the fault. Since these horizontal signals have peak-to-trough amplitudes of 6 mm, they mask the smaller tectonic signals and need to be taken into account when interpreting GPS time series of site position. Moreover, since the groundwater signal appears to have a longterm vertical trend which varies in sign depending on location, it will be difficult to distinguish interseismic tectonic slip along the NIFZ and within the affected areas in the basin.

### METEOROLOGY AND CLIMATOLOGY

Includes weather observation forecasting and modification.

**20030112828** NASA Goddard Space Flight Center, Greenbelt, MD, USA

**Impact of Quikscat Data on Numerical Weather Prediction**

Atlas, Robert; [2002]; 1 pp.; In English; American Geophysical Union Fall Meeting, 6-10 Dec. 2002, San Francisco, CA, USA; No Copyright; Avail: Other Sources; Abstract Only

One of the important applications of satellite surface wind observations is to increase the accuracy of weather analyses and forecasts. Satellite surface wind data can improve numerical weather prediction (NWP) model forecasts by contributing to improved analyses of the surface wind field and air sea fluxes. Through the data assimilation process, these data can also improve atmospheric mass and motion fields in the free atmosphere above the surface. The SeaWinds scatterometer on the QuikScat satellite was launched in July 1999 and represented a dramatic departure in design from the other scatterometer instruments launched during the past decade (ERS-1,2 and NSCAT). The NASA Data Assimilation Office (DAO) was the first data assimilation center to assimilate QuikScat Seawinds data and evaluate their impact on numerical weather prediction. Following the launch of QuikScat, a detailed evaluation of the initial surface wind data sets was performed as part of a collaborative project between the Environmental Modeling Center of NCEP, NESDIS and the DAO. More recently, the impact of Quikscat data was evaluated in detailed experiments using the NCEP operational data assimilation system. As a result of the beneficial impact obtained, NCEP began operational utilization of Quikscat data. Results from these experiments as well as recent DAO assimilation experiments showing the impact of Quikscat data on stratospheric analyses and forecasts will be presented at the meeting.

**Various Numerical Applications on Tropical Convective Systems Using a Cloud Resolving Model**

Shie, C.-L.; Tao, W.-K.; Simpson, J.; [2003]; 1 pp.; In English; Third International Ocean-Atmosphere Conference, 14-16 Jul. 2003, Beijing, China; No Copyright; Avail: Other Sources; Abstract Only

In recent years, increasing attention has been given to cloud resolving models (CRMs or cloud ensemble models-CEMs) for their ability to simulate the radiative-convective system, which plays a significant role in determining the regional heat and moisture budgets in the Tropics. The growing popularity of CRM usage can be credited to its inclusion of crucial and physically relatively realistic features such as explicit cloud-scale dynamics, sophisticated microphysical processes, and explicit cloud-radiation interaction. On the other hand, impacts of the environmental conditions (for example, the large-scale wind fields, heat and moisture advections as well as sea surface temperature) on the convective system can also be plausibly investigated using the CRMs with imposed explicit forcing. In this paper, by basically using a Goddard Cumulus Ensemble (GCE) model, three different studies on tropical convective systems are briefly presented. Each of these studies serves a different goal as well as uses a different approach. In the first study, which uses more of an idealized approach, the respective impacts of the large-scale horizontal wind shear and surface fluxes on the modeled tropical quasi-equilibrium states of temperature and water vapor are examined. In this 2-D study, the imposed large-scale horizontal wind shear is ideally either nudged (wind shear maintained strong) or mixed (wind shear weakened), while the minimum surface wind speed used for computing surface fluxes varies among various numerical experiments. For the second study, a handful of real tropical episodes (TRMM Kwajalein Experiment - KWJEX, 1999; TRMM South China Sea Monsoon Experiment - SCSMEX, 1998) have been simulated such that several major atmospheric characteristics such as the rainfall amount and its associated stratiform contribution, the Q1/heat and Q2/moisture budgets are investigated. In this study, the observed large-scale heat and moisture advections are continuously applied to the 2-D model. The modeled cloud generated from such an approach is termed continuously forced convection or continuous large-scale forced convection. A third study, which focuses on the respective impact of atmospheric components on upper Ocean heat and salt budgets, will be presented in the end. Unlike the two previous 2-D studies, this study employs the 3-D GCE-simulated diabatic source terms (using TOGA COARE observations) - radiation (longwave and shortwave), surface fluxes (sensible and latent heat, and wind stress), and precipitation as input for the Ocean mixed-layer (OML) model.

**Effect of Smoke on Cloud Formation during the Biomass Burning Season over the Amazon Basin**

Koren, I.; Kaufman, Y. J.; Remer, L. A.; [2003]; 1 pp.; In English; EGS-AGU-EUG Joint Assembly, 6-11 Apr. 2003, Nice, France; No Copyright; Avail: Other Sources; Abstract Only

Aerosol absorption of sunlight reduces surface irradiation and heats the aerosol layer. The consequent changes in the temperature and humidity profiles can affect cloud formation extent and life time, which is called the semi-direct effect. We evaluate this aerosol semi-direct effect using data collected during the 2002 biomass burning season over the Amazon basin from the MODIS instrument on the Aqua satellite. MODIS measures the cloud coverage and the aerosol optical thickness among the clouds. We found that the radiative heating of the atmosphere and cooling of the surface due to the presence of

the smoke decreases the cloud coverage. A very clear negative correlation emerges between the cloud fraction and the smoke optical depth. The results are compared to calculations using 1-D radiation model (M.D. Chou), and used to calculate this regional semi direct effect on climate forcing.

#### **Derivation of Aerosol Columnar Mass from MODIS Optical Depth**

Gasso, Santiago; Hegg, Dean A.; [2002]; 1 pp.; In English; American Geophysical Union Fall Meeting, 6-10 Dec. 2002, San Francisco, CA, USA; No Copyright; Avail: Other Sources; Abstract Only

In order to verify performance, aerosol transport models (ATM) compare aerosol columnar mass (ACM) with those derived from satellite measurements. The comparison is inherently indirect since satellites derive optical depths and they use a proportionality constant to derive the ACM. Analogously, ATMs output a four dimensional ACM distribution and the optical depth is linearly derived. In both cases, the proportionality constant requires a direct intervention of the user by prescribing the aerosol composition and size distribution. This study introduces a method that minimizes the direct user intervention by making use of the new aerosol products of MODIS. A parameterization is introduced for the derivation of columnar aerosol mass (AMC) and CCN concentration (CCNC) and comparisons between sunphotometer, MODIS Airborne Simulator (MAS) and in-measurements are shown. The method still relies on the scaling between AMC and optical depth but the proportionality constant is dependent on the MODIS derived  $r_{eff}$ ,  $\eta$  (contribution of the accumulation mode radiance to the total radiance), ambient RH and an assumed constant aerosol composition. The CCNC is derived from a recent parameterization of CCNC as a function of the retrieved aerosol volume. By comparing with in-situ data (ACE-2 and TARFOX campaigns), it is shown that retrievals in dry ambient conditions (dust) are improved when using a proportionality constant dependent on  $r_{eff}$  and  $\eta$  derived in the same pixel. In high humidity environments, the improvement in the new method is inconclusive because of the difficulty in accounting for the uneven vertical distribution of relative humidity. Additionally, two detailed comparisons of AMC and CCNC retrieved by the MAS algorithm and the new method are shown. The new method and MAS retrievals of AMC are within the same order of magnitude with respect to the in-situ measurements of aerosol mass. However, the proposed method is closer to the in-situ measurements than the MODIS retrievals. The retrievals of CCNC are also within the same order of magnitude for both methods. The new method is applied to an actual MODIS retrieval and although no in-situ data is available to compare, it is shown that the proposed method yields more credible values than the MODIS retrievals. In addition, recent data available from the PRIDE (Puerto Rico Dust Experiment, July 2000) will be shown by comparing sunphotometer, MODIS and in-situ data.

#### **Towards Improved MODIS Aerosol Retrieval over the US East Coast Region: Re-examining the Aerosol Model and Surface Assumptions**

Levy, R. C.; Remer, L. A.; Kaufman, Y. J.; Holben, B. N.; [2002]; 1 pp.; In English; American Geophysical Union Fall Meeting, 6-10 Dec. 2002, San Francisco, CA, USA; Copyright; Avail: Other Sources; Abstract Only

The MODerate resolution Imaging Spectrometer (MODIS) aboard the Terra and recently the Aqua platform, produces a set of aerosol products over both ocean and land regions. Previous validation efforts have shown that from a global perspective, aerosol optical depth (AOD) is successfully retrieved from MODIS. Even over coastal regions, the over-land and over-ocean retrievals are consistent with each other, and well matched with ground-based sunphotometer measurements (such as AERONET). However, the East Coast of the USA is one region where there is consistently a discrepancy between land and ocean retrievals. Over the ocean, MODIS AODs are consistent with coastal sunphotometer measurements, but over land, AODs are consistently over-estimated. In this study we use field data from the Chesapeake Lighthouse and Aircraft Measurements for Satellites experiment (CLAMS), (held during summer 2001) to determine the aerosol properties at a number of sites. Using the 6-S radiative transfer package, we compute simulated satellite radiances and compare them with observed MODIS radiances. We believe that the AOD over-estimation is not likely due to an incorrect choice of the urban/industrial aerosol models. Using 6-S to do an atmospheric correction for a very low AOD case, we show rather, that the discrepancies are likely a result of incorrect assumptions about the surface reflectance properties. Understanding and improving MODIS

retrievals over the East Coast will not only improve the global quality of MODIS, but also would enable the use of MODIS as a tool for monitoring regional aerosol events.

**Aerosol Absorption in the Atmosphere: Perspectives from Global Model, Ground-Based Measurements, and Field Observations**

Chin, Mian; Holben, Brent; Anderson, Tad; Quinn, Patricia; Duncan, Bryan; Ginoux, Paul; [2003]; 1 pp.; In English; EGS-AGU-EUG Joint Assembly 2003, 7-11 Apr. 2003, Nice, France; No Copyright; Avail: Other Sources; Abstract Only

Aerosol absorption in the atmosphere poses a major uncertainty in assessing the aerosol climate effects. This uncertainty arises from the poorly quantified aerosol sources, especially black carbon emissions, and our limited knowledge of aerosol mixing state and optical properties. Here we use a global model GOCART to simulate atmospheric aerosols, including sulfate, black carbon, organic carbon, dust, and sea salt. We compare the model calculated total aerosol optical thickness, extinction, and absorption with those quantities from the ground-based sun photometer measurements from AERONET at several different wavelengths and the field observations from ACE-Asia. We will examine what are the most sensitive factors in determining the aerosol absorption, and the consequences of assessing the aerosol radiative forcing and atmospheric heating associated with those factors.

**The Updated Umkehr Ozone Retrieval Algorithm and its Validation against Satellite Data**

Petropavlovskikh, I.; Bhartia, P. K.; Labow, G.; Wellemeyer, C.; [2003]; 1 pp.; In English; EGS-AGU-EUG Joint Assembly, 7-11 Apr. 2003, Nice, France; No Copyright; Avail: Other Sources; Abstract Only

Improvements to the Umkehr ozone profile retrieval algorithm have been developed and are now being evaluated. The updated algorithm is able to simulate observations more accurately and provides data output that is easier to analyze. Among the new diagnostic capabilities that the updated algorithm provides is the averaging kernel (AK) method. The AK approach allows studying how the algorithm responds when a small perturbation is made in a particular layer of the atmosphere [Rodgers 1976, 1990]. We will use the AK method to define precisely what Umkehr should measure given a set of profiles measured by other platforms. This method allows us to compare trends and offsets in data more accurately than it has been done in the past. The updated Umkehr retrievals will be validated against SAGE II ozone profiles as well as SSBUV ozone profile data. We will discuss possible reasons for offset between data and differences in derived ozone profile trends. Considerable variability of the ozone profile within the 10-degree latitude envelope creates noise in the SAGE matching dataset and makes comparisons difficult. To eliminate this problem, the SAGE and Umkehr data had been previously de-seasonalized by subtracting the latitude/season dependent ozone climatology. However, the remaining noise in the ozone residuals was still considerably high for trend analysis and was attributed to longitude variability of SAGE sampling. The new ozone climatology (Labow, NASA) that has longitude dependent ozone variability will be used to minimize contribution of sampling noise in comparisons of satellite and ground station. The comparison of zenith-sky radiances (Umkehr N-value measurements) synthesized for a given set of SAGE profiles will be used to determine whether SAGE-derived N-values agree with the Umkehr-measured N-values. The instrumental effects will be discussed. Both the Umkehr data and SAGE II measurements will be analyzed for their information about ozone variability and loss and recovery rates at the mid- and upper (40 km) levels. The updated long-term Umkehr dataset can be used to provide high quality information for identifying signs of ozone recovery. The long Umkehr historical record can provide additional information for separating the dynamic and chemical mechanisms of depletion, and can help the community better understand climate change effects.

**Modeling Study of Planetary Waves in the Mesosphere Lower Thermosphere (MLT)**

Mengel, J. G.; Mayr, H. g.; Drob, D.; Porter, H. S.; Hines, C. O.; [2003]; 1 pp.; In English; EGS-AGU-EUG Joint Assembly 2003, 7-11 Apr. 2003, Nice, France; Copyright; Avail: Other Sources; Abstract Only

For comparison with measurements from the TIMED satellite and coordinated ground based observations, we present

results from our Numerical Spectral Model (NSM) that incorporates the Doppler Spread Parameterization (Hines, 1997) for small-scale gravity waves (GWs). We discuss the planetary waves (PWs) that are purely generated by dynamical interactions, i.e., without explicitly specifying excitation sources related for example to tropospheric convection or topography. With tropospheric heating that reproduces the observed zonal jets near the tropopause and the accompanying reversal in the latitudinal temperature variation, which is conducive to baroclinic instability, long period PWs are produced that propagate up into the stratosphere to affect the wave driven equatorial oscillations (QBO and SAO) extending into the upper mesosphere. The PWs in the model that dominate higher up in the MLT region, however, are to a large extent produced by instabilities under the influence of the zonal circulation and temperature variations in the middle atmosphere and they are amplified by GW interactions. Three classes of PWs are generated there. (1) Rossby waves that slowly propagate westward but are carried by the zonal mean ( $m = 0$ ) winds to produce eastward and westward propagating PWs respectively in the winter and summer hemispheres below 80 km. Depending on the zonal wave number and magnitudes of the zonal winds under the influence of the equatorial oscillations, the PWs typically have periods between 2 and 20 days and their horizontal wind amplitudes can exceed 40 m/s in the lower mesosphere. (2) Rossby gravity waves that propagate westward at low latitudes, having periods around 2 days for zonal wave numbers  $m = 2$  to 4. (3) Eastward propagating equatorial Kelvin waves generated in the upper mesosphere with periods between 2 and 3 days for  $m = 1$  & 2. The seasonal variations of the PWs reveal that the largest wind amplitudes tend to occur below 80 km in the winter hemisphere, but above that altitude in the summer hemisphere to approach magnitudes as large as 50 m/s.

**SPARC-IGAC Symposium on Climate-Chemistry Interactions. Climate Feedback by Water Vapor in the Tropical Upper Troposphere**

Dessler, A. E.; Minschwaner, K.; [2003]; 1 pp.; In English; EGS-AGU-EUG Joint Assembly 2003, 6-11 Apr. 2003, Nice, France; Copyright; Avail: Other Sources; Abstract Only

The strong greenhouse forcing by atmospheric water vapor is expected to play an important role in shaping the direction of any future changes in climate. We present calculations that provide a new perspective on the sensitivity of upper tropospheric water vapor to changes in surface temperature. Equilibrium states of our atmospheric model show unambiguously that as the surface warms, changes in the vertical distribution and temperature of detraining air parcels from tropical convection lead to higher water vapor mixing ratios in the upper troposphere. However, the increase in mixing ratio is not as large as the increase in saturation mixing ratio due to warmer environmental temperatures, so that the relative humidity decreases. Our analysis suggests that models that maintain a fixed relative humidity are likely overestimating the magnitude of the water vapor feedback.

**Non-Migrating Tides, with Zonally Symmetric Component, Generated in the Mesosphere**

Mayr, H. G.; Mengel, J. G.; Talaat, E. R.; Porter, H. S.; Hines, C. O.; [2003]; 1 pp.; In English; EGS-AGU-EUG Joint Assembly 2003, 7-11 Apr. 2003, Nice, France; No Copyright; Avail: Other Sources; Abstract Only

For comparison with measurements from the TIMED satellite and coordinated ground based observations, we discuss results from our Numerical Spectral Model (NSM) that incorporates the Doppler Spread Parameterization (Hines, 1997) for small-scale gravity waves (GWs). The NSM extends from the ground into the thermosphere and describes the major dynamical features of the atmosphere including the wave driven equatorial oscillations (QBO and SAO), and the seasonal variations of tides and planetary waves. With emphasis on the non-migrating tides, having periods of 24 and 12 hours, we discuss our modeling results that account for the classical migrating solar excitation sources only. As reported earlier, the NSM reproduces the observed seasonal variations and in particular the large equinoctial maxima in the amplitude of the migrating diurnal tide at altitudes around 90 km. Filtering of the tide by the zonal circulation and GW momentum deposition was identified as the cause. The GWs were also shown to produce a strong non-linear interaction between the diurnal and semi-diurnal tides. Confined largely to the mesosphere, the NSM produces through dynamical interactions a relatively large contribution of non-migrating tides. A striking feature is seen in the diurnal and semi-diurnal oscillations of the zonal mean ( $m = 0$ ). Eastward propagating tides are also generated for zonal wave numbers  $m = 1$  to 4. When the NSM is run without GWs, the amplitudes for the non-migrating tides, including  $m = 0$ , are generally small. Planetary wave interaction and non-linear coupling that involves the filtering of GWs and related height integration of dynamical features are discussed as possible mechanisms for

generating these non-migrating tides in the NSM. As is the case for the solar migrating tides, the non-migrating tides reveal persistent seasonal variations. Under the influence of the QBO and SAO, interannual variations are produced.

**Analysis of Diurnal, Planetary and Mean Wind Activity using TIMED, MF and Meteor Radar Winds**

Lieberman, Ruth S.; Riggan, Dennis R.; December 08, 2003; 9 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): NASW-00040

Report No.(s): NWSA-CoRA-03-R269; No Copyright; Avail: CASI; [A02](#), Hardcopy

The goals of this research are: 1) To validate TIMED Doppler Interferometer (TIDI) winds using ground-based MF and meteor winds; and 2) To examine short-term (i. e., day-to-day and week-to-week) variability of the diurnal tide. This objective was to have originally been met using comparisons of short-term diurnal tidal determinations from ground-based (GB) winds with planetary-scale diurnal nonmigrating tidal definitions from TIDI winds.

**Optimization of CAD System Using Adaptive Simulated Annealing for Digital Mammography**

Sun, Xuejun; Qian, Wei; Jul. 2003; 9 pp.; In English

Contract(s)/Grant(s): DAMD17-01-1-0396

Report No.(s): AD-A418349; No Copyright; Avail: CASI; [A02](#), Hardcopy

Mammography is the most effective method to date and is becoming a high volume X-ray procedure for screening and diagnosing breast cancer. The performance of computer- aided detection and diagnosis (CAD) scheme determines its clinical effectiveness as an objective 'second reader' in aiding radiologists' mammogram interpretation. Following research work of initial grant year, the major research works in the second grant year are: (1) to construct CAD system robust to FFDM and SFM, (2) to fully optimize the CAD system for its overall performance improvements in both sensitivity and specificity. The major accomplishments in the second grant year are as follows: (1) New modules have been developed, including preprocessing for normalization of mammographic images from PFDM and SFM, adaptive Fuzzy-C means algorithm for segmentation, support vector machine (SVM) technique for classification. Adaptive modules have been modified based on existing modules. (2) Adaptive CAD system has been constructed using developed and modified modules. (3) Fully optimization of CAD system by simulated annealing (SA) algorithm has been developed and performed. Key parameters affecting performance of CAD system have been selected as optimization variables. Modular and full system optimizations have been performed, respectively, on CAD system.

**Breast Cancer Susceptibility Genes in High Risk Women**

Hamilton, Ann S.; Jul. 2003; 23 pp.; In English

Contract(s)/Grant(s): DAMD17-00-1-0431

Report No.(s): AD-A418351; No Copyright; Avail: CASI; [A03](#), Hardcopy

A positive family history, present in about 30% of breast cancer cases, has been shown to double a woman's risk of breast cancer. The genetic factors responsible are largely unknown, although the autosomal dominant, relatively high penetrant genes BRCA1/2 may account for 3%. It has been hypothesized that susceptibility genes of lower penetrance may also affect breast cancer risk, and a likely group of such genes are those that regulate the production, intracellular transport, and metabolism of estrogen. Previous studies of these susceptibility genes have not been conducted with women with high familial risk. This

study is being conducted with identical twins with differing genetic risks (i.e. concordant for breast cancer pairs vs. discordant pairs) as well as unaffected controls. We have chosen to focus on those genes related to estrogen metabolism and carcinogen metabolism. In the estrogen metabolism pathway, polymorphisms have been described related to the CYP17 gene, the CYP19 gene, the COMT gene, and the HSD17B1 gene. Genes related to carcinogen metabolism which have been linked to breast cancer risk include GSTM1 and Pt and CYP1A1. We will compare the frequency of selected polymorphisms in these genes in 200 breast cancer concordant, 200 discordant, and 200 control women. We currently have tissue or buccal smears and informed consents from 130 concordant, 152 discordant, and 133 control women. Laboratory analyses of the CYP17 gene have shown some inconsistencies with repeat testing and additional testing is being done to assure that the results are accurate. Once the assay method has been validated, additional genes will be tested..

**Folate and Breast Cancer: Role of Intake, Blood Levels and Metabolic Gene Polymorphisms**

Shrubsole, Martha J.; Zheng, Wei; Jun. 2003; 30 pp.; In English

Contract(s)/Grant(s): DAMD17-02-1-0606

Report No.(s): AD-A418353; No Copyright; Avail: CASI; [A03](#), Hardcopy

The purpose of this application is training in nutritional and molecular epidemiology with the eventual goal of establishing an independent investigator. The hypothesis major hypothesis of the project is that high folate intake is associated with a decreased breast cancer risk particularly among those with MTHFR, MTR, and MTRR polymorphisms. The specific aims of this postdoctoral training proposal are 1) further methodological training in the analysis of gene-gene and gene-environment interactions by studying folate intake and folate metabolic gene polymorphisms (MTHFR, MTR, MTRR) using data collected in a population-based breast cancer case-control study (approximately 3000 subjects), 2) training in the methodology of cohort studies through designing and implementing a newly proposed nested case-control study of breast cancer (350 pairs) to examine folate intake, plasma folate, and metabolic gene polymorphisms, 3) coursework in nutrition and cancer biology and 4) participation in the field work of a recently submitted breast cancer case-control study and 5) development of a grant proposal examining folate, global DNA methylation and uracil misincorporation in breast cancer risk.

**Beam Delivery Verification for Modulated Electron Radiation Therapy Treatment of Breast Cancer**

Ponineau, Maxime; Boyer, Arthur L.; Aug. 2003; 10 pp.; In English

Contract(s)/Grant(s): DAMD17-01-1-0402

Report No.(s): AD-A418355; No Copyright; Avail: CASI; [A02](#), Hardcopy

Detecting and monitoring cellular and molecular changes associated with cancer are essential to the verification of cancer treatment. In this investigation we show that modulated electron radiation therapy can in principle conform a region of high dose to a volume of malignant breast tissue. Currently available means to both measure the malignant volume and record progression of its response to radiation are limited. We therefore chose to explore another means to determine the breast treatment target; optical tomography. Using the fact that mammalian tissues transmit light at a low level and emit virtually no light at all, optical signatures conferred on tumor cells by expression of reporter genes can be detected externally by photon-detecting systems. In this paper we study a first approach to a gradient-based iterative procedure using a finite-difference scheme as forward model. We provide results at the current state of research and discuss ways to address current limitations.

**Neural Protein Synuclein Gamma (SNCG) in Breast Cancer Progression**

Jiang, Yangfu; Jul. 2003; 10 pp.; In English

Contract(s)/Grant(s): DAMD17-01-1-0352

Report No.(s): AD-A418359; No Copyright; Avail: CASI; [A02](#), Hardcopy

Synucleins are emerging as a central player in the fundamental neural processes and in the formation of pathologically insoluble deposits characteristic of Alzheimer's (AD) and Parkinson's (PD) diseases. However, the normal cellular function

of this highly conserved synuclein family remains largely unknown. Using differential cDNA sequencing approach, we first identified a breast cancer specific gene, BCSG1, which was expressed abundantly in metastatic breast cancer cDNA library but scarcely in normal breast cDNA library. Interestingly, BCSG1 revealed no homology to any other known growth factors or oncogenes; rather, BCSG1 revealed extensive sequence homology to neurotic proteins of alpha synuclein and beta synuclein, and thus was also named as gamma Synuclein (SNCG). SNCG expression is highly associated with breast cancer and ovarian cancer progression. In addition, overexpression of SNCG in breast cancer cells significantly stimulated cell growth in vitro and tumor metastasis in vivo. However, the molecular targets of SNCG aberrant expression for breast cancer have not been identified. For the first time, we report a chaperone-like activity of SNCG in stimulating the transcriptional activity of estrogen receptor-alpha(ER-alpha) in breast cancer cells. Consistent with the stimulation of ER- alpha, SNCG stimulated the ligand-dependent cell proliferation. While overexpression of SNCG stimulated the ligand-dependent cell proliferation, suppression of endogenous SNCG expression significantly inhibited cell growth in response to estrogen. The stimulatory effect of SNCG on ERalpha-regulated gene expression and cell growth can be effectively inhibited by antiestrogens. Demonstration of the stimulation of ER-alpha signaling as one of the cellular functions of SNCG will have a great impact on the biology of steroid receptors and the pathological role of SNCG on hormone-responsive tumors including breast, ovary, and prostate.

Martin, Peter J.; Oct. 2003; 14 pp.; In English

Contract(s)/Grant(s): DAMD17-01-C-0037

Report No.(s): AD-A418365; No Copyright; Avail: CASI; [A03](#), Hardcopy

The purpose of this program is to demonstrate the applicability of advanced digital medicine techniques to military medicine. It consists of two parts: Critical Care and Chronic Care. The Critical Care portion of this program enables a doctor at Tripler Army Medical Center (TAMC) to view patients and data from patients in the ICU at USNH Guam. This portion of the program was subcontracted to VISICU, a company which has installed --somewhat similar systems in the past. The Chronic Care portion is intended to enable a physician to monitor blood glucose and blood pressure taken by patients in their homes from the physician's office. The hardware and software components for the Chronic Care portion are largely complete. The components work in a test setting, but due to difficulties obtaining approvals from IRB and other relevant groups, the hardware and software have not been tested in a doctor/patient setting during this program.

**The Development of the Tactical Medical Logistics Planning Tool (TML+)**

Tropeano, Anne; Konoske, Paula; Mitchell, Ray; Brock, Johnny; Parker, Joe; Oct. 31, 2003; 23 pp.; In English

Contract(s)/Grant(s): Proj-M0095

Report No.(s): AD-A418273; No Copyright; Avail: CASI; [A03](#), Hardcopy

The Tactical Medical Logistics Planning Tool (TML+) is a software program designed for Navy and Marine Corps medical planners as a tool that: (1) models the patient flow from the point of injury through more definitive care, and (2) supports operations research and systems analysis studies, operational risk assessment, and field medical services planning. TML+ is designed with a user-friendly graphical user interface, an open architecture, and four program modules. The casualty generation module uses an exponential distribution to stochastically generate wounded in action, disease, and nonbattle injuries. The care-providing module uses generic task sequences; simulated treatment times; and personnel, consumable supply, and equipment requirements to model patient treatment and queuing within a functional area. The network/transportation module simulates the evacuation (including queuing) and routing of patients through the network of care via transportation assets. The reporting module produces an Access database detailing myriad metrics, such as patient disposition, time-in-system data, and consumable, equipment, personnel and transportation usage, which can be filtered according to the user's needs. TML+ can be used before deployment as a deliberate planning tool or during deployment as a crisis-action tool that assists planners in responding to the rapidly changing wartime environment.

**The Effect of COX-2 Inhibitors on the Aromatase Gene Expression in Human Breast Cancer**

Shapiro, Charles L.; Burak, William; Brueggemeier, Robert; Jun. 2003; 4 pp.; In English

Contract(s)/Grant(s): DAMD17-01-1-0589

Report No.(s): AD-A418325; No Copyright; Avail: CASI; [A01](#), Hardcopy

Aromatase (CYP-19) is responsible for estrogen biosynthesis within breast tumor tissue. Aromatase and cyclooxygenase-2 (COX-2) are both overexpressed in human breast cancer, and increased levels of prostaglandin (PG) activates the CYP19 promotor and increases gene expression. We hypothesize that celecoxib, a selective COX-2 inhibitor, will decrease PG, decrease the expression of CYP19, and reduce estrogen biosynthesis within tumor tissue. To test this hypothesis, in DOD grant # DAMD17-01-1-0589, tumor tissue will be collected from breast cancer patients at the initial diagnosis, and again at the definitive surgery (lumpectomy or mastectomy) for breast cancer. In the 10-14 day interval before the definitive surgery, patients will receive celecoxib and tissue samples collected before and after treatment with celecoxib will be evaluated for gene expression of COX-2 and CYP19. If our hypothesis is correct, then expression of the CYP19 gene will decrease in response to celecoxib. This study will provide preliminary data to a) support a mechanism whereby COX-2 inhibitors decrease estrogen production within breast tumors by decreasing CYP19 expression; and b) provide the rationale for initiating larger chemoprevention and therapeutic trials of COX-2 inhibitors in high risk and breast cancer patients.

Contract(s)/Grant(s): DAMD17-02-1-0484

Report No.(s): AD-A418336; No Copyright; Avail: CASI; [A02](#), Hardcopy

Breast cancer (BC) is a heterogeneous disease with varying clinical behavior, and response to therapy that cannot be predicted based on clinical and pathologic classifications. It is the primary goal of our research to identify and characterize biological pathways and individual molecular components that play a primary role in BC development and progression. In order to identify genes, gene expression profiles and molecular pathways associated with metastatic BC we have performed genome-wide gene expression analysis of a large number of breast cancer samples. Both unsupervised and supervised analyses are being used to identify genes differentially expressed among samples. Hierarchical clustering showed that most samples grouped according to estrogen receptor status. In addition, matched primary carcinomas and lymph node metastases tended to pair demonstrating marked conservation of molecular phenotype within patients. Formal statistical testing is being used to identify genes with marked changes in expression during progression. Lymph node metastases in particular showed significant decreases in the expression of many genes corresponding to extracellular matrix proteins and proteases when compared to matched primaries. Further expression changes in a variety of genes were associated with distant metastases. Immunohistochemistry and in situ hybridization are being used to validate and extend findings.

**The Role of MEKK3 Signaling Pathway in the Resistance of Breast Cancer Cells to TNF- (alpha) -Mediated Apoptosis**

Huang, Qiaojia; May 2003; 8 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DAMD17-02-1-0449

Report No.(s): AD-A418337; No Copyright; Avail: CASI; [A02](#), Hardcopy

In the past year, I focused my research on testing the hypothesis is that NF-kB activation in breast cancer cells plays a critical role in cancer cells' resistance to anti- cancer drugs and to TNF-alpha treatment, and MEKK3 is an essential component of this process. I constructed expression vectors that express dominant negative forms of MEKK3 that will be used to block the MEKK3-down stream cascades. I tested their expression and activities in various cells and found that the transfection efficiency in breast cancer cells is very low as compared to other cell lines such as COS-1 and 293T. In order to utilize these constructs in breast cancer cell, it is necessary to make retroviral vectors. This work is currently in progress. The second part of my research involves assaying NF-kB activation since it is the key target of MEKK3. I tested the NF-kB reporter activation, IkbA degradation, and NF-xB DNA binding activity. Finally, I have been working on the siRNA technique so that we can use MEKK3 SIRNA to inhibit the MEKK3 expression in breast cancer cells, and then test whether this will

render the cancer cells sensitive to TNF- alpha and hopefully to other anti-cancer drugs as well.

**Tindallia californiensis sp. nov., a new anaerobic, haloalkaliphilic, spore-forming acetogen isolated from Mono Lake in California**

Pikuta, E. V.; Hoover, R. B.; Bej, A. K.; Marsic, D.; Detkova, E. N.; Whitman, W. B.; Krader, P.; Extremophiles; May 1, 2003; Volume 7, pp. 327-334; In English; Copyright; Avail: Other Sources

A novel extremely haloalkaliphilic, strictly anaerobic, acetogenic bacterium strain APO was isolated from sediments of the athalassic, meromictic, alkaline Mono Lake in California. The Gram-positive, spore-forming, slightly curved rods with sizes 0.55- 0.7x1.7-3.0 microns were motile by a single laterally attached flagellum. Strain APO was mesophilic (range 10-48 C, optimum of 37 C); halophilic (NaCl range 1-20% (w/v) with optimum of 3-5% (w/v), and alkaliphilic (pH range 8.0-10.5, optimum 9.5). The novel isolate required sodium ions in the medium. Strain APO was an organotroph with a fermentative type of metabolism and used the substrates peptone, bacto-tryptone, casamino acid, yeast extract, L-serine, L-lysine, L-histidine, L-arginine, and pyruvate. The new isolate performed the Stickland reaction with the following amino acid pairs: proline + alanine, glycine + alanine, and tryptophan + valine. The main end product of growth was acetate. High activity of CO dehydrogenase and hydrogenase indicated the presence of a homoacetogenic, non-cycling acetyl-coA pathway. Strain APO was resistant to kanamycin but sensitive to chloramphenicol, tetracycline, and gentamycin. The G+C content of the genomic DNA was 44.4 mol% (by HPLC method). The sequence of the 16s rRNA gene of strain APO possessed 98.2% similarity with the sequence from Tindullia magadiensis Z-7934, but the DNA-DNA hybridization value between these organisms was only 55%. On the basis of these physiological and molecular properties, strain APO is proposed to be a novel species of the genus Tindallia with the name Tindallia californiensis sp. nov., (type strain APO = ATCC BAA-393 - DSM 14871).

### **Nuclear Magnetic Resonance Spectrometer Console Upgrade for a Type II quantum Computer**

Cory, David G.; Nov. 19, 2003; 8 pp.; In English

Contract(s)/Grant(s): F49620-02-1-0250

Report No.(s): AD-A418330; AFRL-SR-AR-TR-03-0477; No Copyright; Avail: CASI; [A02](#), Hardcopy

As proposed, we upgraded the system console on an existing Bruker Instruments, 14 T nuclear magnetic resonance (NMR) spectrometer to enable an improved implementation of type II quantum computers (TTQC). This upgrade is fully functional and has permitted our NMR studies to be moved to higher strength magnetic fields for better sensitivity and spectral dispersion. The TTQC experiments continue in collaboration with Dr. J. Yepez of the Air Force Research Laboratory. We have completed studies of the I-D dynamics of the diffusion equation and the Burger's equation with various viscosity. We have nearly completed additional studies showing both the scaling of errors in TTQC and a new novel mapping to reciprocal space lattices. The latter is hoped to be a first step toward running the TTQC with a closed feedback loop. The closed loop computations will permit continuous quantum computation in a lattice gas architecture.

This report provides information about technologies for viewing computer-aided design (CAD) models. CAD model viewers are tools that allow engineers and other users to view CAD models from distributed locations, often using lightweight viewing applications or standard Web browsers. The report describes factors to consider when choosing a viewing technology, as well as popular CAD model file formats that viewing technologies can import. Also provided is a sampling of commercial off-the-shelf (COTS) products currently available for viewing CAD models; descriptive information for each product, such as basic product functionality, purchase price, computer platform support, file format support; and a related World Wide Web Universal Resource Locator.

### **DoD Experience with the C4ISR Architecture Framework**

Wood, William G.; Cohen, Sholom; Sep. 2003; 38 pp.; In English

Contract(s)/Grant(s): F19628-00-C-0003

Report No.(s): AD-A418352; CMU/SEI-2003-TN-027; No Copyright; Avail: CASI; [A03](#), Hardcopy

The Department of Defense (DoD) is mandating the use of the Command, Control, Communications, Computer, Intelligence, Surveillance and Reconnaissance Architecture Framework (C4ISRAF) for large-scale software-intensive systems. The authors conducted eight interviews with personnel who have used the C4ISRAF in acquisition projects. The intent of the interviews was to find the strengths and weaknesses of the C4ISRAF, so that this information could be related to future users of the framework. This technical note discusses the context for using the C4ISRAF, the observations made

during the interviews about its use, and the strengths and challenges of using it. Suggestions for overcoming these challenges also are included.

Contract(s)/Grant(s): F19628-00-C-0003

Report No.(s): AD-A418354; CMU/SEI-2003-TN-030; No Copyright; Avail: CASI; [A03](#), Hardcopy

Prediction-enabled component technology (PECT) is an approach to predicting the behavior of systems built from components with known properties. An important artifact produced by the PECT development process is the documentation of the technologies, tools, and theories as integral elements of the PECT, as well as the results and conclusions of the application of the PECT to a group of systems. This report suggests a template for documenting a PECT. The report also provides guidelines and a few examples to help PECT developers consolidate the broad range of information produced in the PECT development process into a single, organized volume.

**The Influence of Multimedia-Based Parent and Adolescent Interventions of Substance Abuse Among Poor Youth**

Ozanian, Alfred J.; Jan. 2003; 165 pp.; In English

Report No.(s): AD-A418324; AFIT-CI02-1304; No Copyright; Avail: CASI; [A08](#), Hardcopy

Several aspects of an adolescent's life have been shown to be influential in predicting their substance use. However, reaching specific areas of an adolescent's life has been hampered by various environmental and cultural barriers. Today, it may be possible to reach an adolescent, and those around them, with multi-media technologies. This study examines the effectiveness of using multimedia-based interactive technologies coupled with conventional interventions to prevent adolescent substance use. Computer Assisted Skills Training (CAST) interventions with youth, and video and face-to-face interventions with parents, were used to disseminate a science-based substance use prevention program. The enhancement of individual, peer, family, and school protective factors, and the reduction in the incidence of adolescent substance use among low-income African American, Latino, and White adolescents was evaluated. Study participants were predominantly 9-13 years old from low-income, high-risk families that utilized community service organizations in the greater New York City area. Sites included 17 Boys and Girls Clubs of America, 6 Police Athletic Leagues, 9 United Neighborhood House organizations, 5 Independent Service Agencies, and 1 YMCA. Using an experimental design, study sites were stratified by race and then randomly assigned to one of three groups: (1) no intervention control group, (2) CAST only, and (3) parent-CAST group. Adolescents in the parent-CAST group demonstrated improved protective factors and reduced entry level and middle risk drug use compared with the other two study groups. The control group had fewest protective factors and greatest entry level and middle risk substance use. Dose analysis of CAST intervention and parent training revealed the CAST intervention reduced the initiation of substance use. There is anecdotal support that the CAST and parent interventions collectively provided adolescents with greater protection from substance use.

**Software and Hardware Sound Analysis Tools for Field Work**

Pavan, G.; Manghi, M.; Fossati, C.; Jan. 1999; 9 pp.; In English

Report No.(s): AD-A418328; No Copyright; Avail: CASI; [A02](#), Hardcopy

The latest version of the real-time Digital Signal Processing Workstation developed at CIBRA runs in a standard Windows environment and can use a wide range of sound acquisition devices. It can be based on a notebook to allow on- field use. Depending on the acquisition devices, recording, analysis and display can be performed in real-time up to 500 k samples/sec to provide useful bandwidth to more than 200 kHz. The software was primarily developed for continuous real-time monitoring in bioacoustical studies.

Gruppen, Roderic; Oct. 22, 2003; 8 pp.; In English

Contract(s)/Grant(s): DABT63-99-1-0022

Report No.(s): AD-A418204; TR-01; No Copyright; Avail: CASI; [A02](#), Hardcopy

Our project created and disseminated new technologies for coordinating the behavior of large numbers of form factor constrained mobile robots. Simulations and robotic experiments were created to demonstrate coordination constraints expressed in a controlled theoretic framework in a manner that guarantees performance (time, energy, and comm bandwidth), scales to hundreds of individuals, and supports optimization via reinforcement learning to acquire distributed control policies. We have implemented 10 'uBots' to realize our SDR concept on which we have demonstrated adaptive impedance control, multi-robot coordination and dynamic role assignment, a real-time process scheduler, and wearable interfaces. Applications, including: search and mapping; leader-follower control; and multi-robot behavior for preserving network connectivity among coordinated peers. Performance bounds on an n-robot teams using network- distributed interfaces have been demonstrated as well. Twelve students are involved in our SDR project. We ported control code for autonomous grasping and manipulation gaits for robot hands to our colleagues at NASA-JSC for use in the Robonaut program and our simulation for multi-robot search controllers that maintain line of sight was transferred to colleagues at SPAWAR.

**Improved Target Identification of Correlated Input Data Using Recurrent Neural Networks and Feature Selection**

Laine, Trevor I.; Bauer, Kenneth W.; Jun. 12, 2003; 29 pp.; In English

Report No.(s): AD-A418271; No Copyright; Avail: CASI; [A03](#), Hardcopy

For non-cooperative targets, combat ID may be accomplished by fusing data obtained from multiple sensors taken across time periods using ATR algorithms. With some ambiguity existing amongst fusion models, definitions are first developed to identify the specific type of fusion to be performed. Since input features extracted from sensor data for ATR algorithms are likely to contain significant correlation, models such as artificial neural networks that do not assume independent input data are a viable approach for fusion. An experiment was designed to assign generated temporal data with significant autocorrelation, cross correlation and noise into one of two classes. This feasibility study assesses use of an Elman recurrent neural network to perform fusion of multiple sensors with multiple looks to accomplish target identification. To improve classification accuracy, feature saliency screening was performed to select a subset of eight candidate input features with a

signal-to-noise ratio and a network output sensitivity based measure. Both measures indicate a subset of about three of the original eight features should be retained. When comparing the two methods, both selection and ranking of salient features is consistent. Numerical results show the parsimonious subset of features improved generalization by significantly reducing the classification accuracy variance across multiple data sets and through time periods. Additionally, the reduced feature set yields an increase in the observed classification accuracy for the last time period of the external validation set.

#### **Low-Complexity Interior Point Algorithms for Stochastic Programming: Derivation Analysis and Performance Evaluation**

Ariyawansa, K. A.; Jan. 2000; 17 pp.; In English

Contract(s)/Grant(s): DAAD19-00-1-0465

Report No.(s): AD-A418278; ARO-39877.14-MA; No Copyright; Avail: CASI; [A03](#), Hardcopy

The broad purpose of this project was to investigate low-complexity interior point decomposition algorithms for stochastic programming. A specific objective was to evaluate algorithms using test problems arising from useful applications. The important direct results of this project include: (1) a new test problem collection that includes problem instances from a variety of application areas; (2) a new package of C-routines for converting SMPS input data into data structures more suitable for implementing algorithms; (3) a new software package, CPA, for two-stage stochastic linear programs. The test problems and input conversion routines have been developed in a general manner to be useful to other researchers. CPA includes volumetric center algorithms that proved to be successful in our computational evaluations. To the best of our knowledge, CPA is the only software for stochastic programming that includes volumetric center algorithms. Items (1), (2) and (3) are freely accessible over the Internet. The important theoretical results of this project include: (4) a new characterization of convexity-preserving maps; (5) a new coordinate-free foundation for projective spaces; (6) a new geometric characterization of one-dimensional projective spaces; (7) new algorithms for bound-constrained nonlinear optimization. These theoretical results are likely to be useful in computational optimization in general.

**20030112909** Air Force Studies and Analyses Agency, Washington, DC

#### **Improving Aircraft Beddown: Estimates for Conducting Combat Operations**

Koewler, David A.; Oct. 31, 2003; 18 pp.; In English

Report No.(s): AD-A418366; No Copyright; Avail: CASI; [A03](#), Hardcopy

To conduct effective combat operations, the Air Force needs to deploy the right mix of aircraft to the right airfield. When too many aircraft are assigned to an airfield, its infrastructure is overwhelmed and aircraft mission effectiveness is degraded. Our current planning capability and our analysis of current and future scenarios must be logistically flexible and robust enough to account for the changes in world politics, where bases we planned to use today might not be available tomorrow. To improve AFSAA's (Air Force Studies and Analyses Agency) capability to quickly estimate beddown plans, we made enhancements to our logistics-planning tool, CBLP (Capabilities Based Logistics Planner). We made it easier to identify potential airfields, and added dynamic tables to display the reduced capabilities of the airfields, as aircraft are bedded down. These enhancements have been used at AFSAA to build more realistic beddown plans for use in our analysis. A web-based version of CBLP is being developed for demonstration in JEFX (Joint Expeditionary Forces Experiment) O4 under the C2 (Command and Control)

Battlelab's Visualization of Expeditionary Sites Tools (VEST) initiative. This paper explains the enhancements made and the heuristic developed to estimate the parking capability of the airfields.

Report No.(s): AD-A418179; AFRL-SR-AR-TR-03-0463; No Copyright; Avail: CASI; [A02](#), Hardcopy

During the current grant period, we considered two things. Our first goal was to provide a simple algorithm for integration into IFDS 2 software that was scheduled to replace IFDS 1. The main purpose of this algorithm is to provide immediate relief. After accomplishing this, we undertook the task of finding techniques to significantly improve effect usage of frequency spectrum. What follows is our preliminary report on our ongoing investigation. The goal of our research is to consider various relaxation of the rigidity of tasks and suggest efficient management algorithm for frequency assignment. There are many ways to relax the rigidity of a task. Observe that there are six numerical information that user provides with each task. We can relax a task by taking any one of this numerical value and change it to an interval where any value in the intervals is acceptable to the user.

**A Method for Allocating Financial Resources to Combat Terrorism: Optimizing the Reduction of Consequences**

Mackin, T. J.; Henderson, Darrall; Jones, J. W.; Jun. 13, 2003; 18 pp.; In English

Report No.(s): AD-A418274; No Copyright; Avail: CASI; [A03](#), Hardcopy

The National Strategy for Homeland Security established three strategic objectives: (1) Prevent terrorist attacks within the USA, (2) Reduce America's vulnerability to terrorism, and (3) Minimize the damage and recover from attacks that do occur. Objectives 1 and 3 essentially reprogram and reprioritize activities within existing agencies such as the FBI, Customs, the Coast Guard and FEMA, while objective 2 presents an entirely new examination of the Nation's infrastructure. Since the USA cannot counter all possible threats, the Department of Homeland Security is actively developing a risk-based management framework to prioritize vulnerabilities and to fund activities that most effectively reduce the nation's vulnerability to terrorist attack. This paper presents a mathematical framework for resource allocation to decrease America's vulnerability to terrorist attack. The authors introduce mathematical expressions that allow decision makers to allocate resources in a manner that maximizes the reduction in vulnerability to terrorist attack, subject to budget constraints. They introduce a delayed return function that captures the effect of long-term investments in risk-mitigation activities (such as R&D) that may not have a short-term pay-off, but whose long-term contribution is substantial. The method is demonstrated using illustrative scenarios and a linear programming approach.

**A Sensor Management Model Using Simulation-Based Approximate Dynamic Programming**

Bland, William S.; Patek, Stephen D.; Der, Sandor Z.; Oct. 31, 2003; 28 pp.; In English

Report No.(s): AD-A418276; No Copyright; Avail: CASI; [A03](#), Hardcopy

This paper presents a new approach to sensor management of distributed sensor networks (DSNs). Given the current proliferation of remote sensors and their inherent resource constraints, DSN managers face a growing problem of managing the tradeoff between DSN performance and resource consumption. Our model, the Sensor Network Optimal Operations Simulator, or SNOOPS, addresses this tradeoff by identifying a DSN control strategy that reaches an acceptably certain representation of the search region while minimizing operating costs. The core of the SNOOPS model is an approximate dynamic programming (ADP) process that uses simulation-based policy iteration to identify an efficient DSN control strategy. Results indicate that the SNOOPS-recommended DSN control strategy improves the efficiency of DSN operations by up to 47 percent over the Base Policy of activating all sensors. In addition to determining efficient DSN control strategies, our model also provides a research base to: (1) investigate the fusion of observations from disparate sensors, (2) demonstrate the use of

non-imaging sensors to provide adequate situational awareness where precision emplacement of more-capable sensors is not possible, and (3) develop operational concepts to integrate DSN operations with user needs.

#### **Understanding Body-Fixed Sensor Output From Projectile Flight Experiments**

Harkins, Thomas E.; Sep. 2003; 33 pp.; In English; Original contains color illustrations

Report No.(s): AD-A418331; ARL-TR-3029; No Copyright; Avail: CASI; [A03](#), Hardcopy

Accurate measurement of in-flight kinematics significantly contributes to the development of experimental projectiles and rockets and to diagnostics for existing munitions and weapons systems. Ground-based instruments such as radar and cameras provide useful measurements but are often limited to portions of a trajectory and/or have limited resolution. On-board sensor systems fixed to a projectile body combined with a telemetry system can provide high resolution continuous data throughout a projectile's entire trajectory. However, there is a twofold difficulty in correctly interpreting and employing data from body-fixed sensors. First, sensor responses many times are affected by stimuli other than those which a sensor is intended to quantify, e.g., an angular rate sensor may be affected by any g forces to which it is subjected. Second, sensor systems often, of necessity, make measurements in a body-fixed coordinate system, and the quantities whose values are desired are best described in another coordinate system. This report treats issues affecting the output of the body-fixed sensors used by the U.S. Army Research Laboratory's Weapons and Materials Research Directorate (Advanced Munitions Concepts Branch) in flight tests of military ordnance and provides the mathematics necessary to transform body-fixed measurements to earth-fixed parameters.

#### **Effects of Underwater Noise on Marine Mammals**

Pavan, Gianni; Feb. 2002; 4 pp.; In English

Report No.(s): AD-A418370; X5-X5; No Copyright; Avail: CASI; [A01](#), Hardcopy

In the Mediterranean Sea marine life is threatened by habitat degradation due to human activities such as fisheries, ship traffic, pollution, and coast anthropization. Other than being effected by chemical pollution, which may contaminate the whole marine food web, cetaceans can also be effected by noise pollution. The underwater environment has its own acoustic peculiarities and cetaceans are extraordinarily well adapted to them. In these mammals, acoustic communication has acquired a privileged role compared with other communication channels. Marine mammals live in a medium which poorly transmits light but through which sound propagates very well, even over long distances. Marine mammals heavily rely on sound to communicate, to exploit and investigate the environment, to find prey and to avoid obstacles. The effect of anthropogenic noise on the marine environment is a new serious concern for scientists.

### **Observations of Glide and Decomposition of $\alpha(101)$ Dislocations at High Temperatures in Ni-Al Single Crystals Deformed along the Hard Orientation**

Srinivasan, R.; Daw, M. S.; Noebe, R. D.; Mills, M. J.; February 1, 2003; 13 pp.; In English

Contract(s)/Grant(s): DE-FG02-96ER-45550; RTOP 708-31-13; 22-708-31-02; Copyright; Avail: Other Sources

Ni-44at.% Al and Ni-50at.% single crystals were tested in compression in the hard (001) orientations. The dislocation processes and deformation behavior were studied as a function of temperature, strain and strain rate. A slip transition in NiAl occurs from  $\alpha(111)$  slip to non- $\alpha(111)$  slip at intermediate temperatures. In Ni-50at.% Al single crystal, only  $\alpha(010)$  dislocations are observed above the slip transition temperature. In contrast,  $\alpha(101)(101)$  glide has been observed to control deformation beyond the slip transition temperature in Ni-44at.%Al.  $\alpha(101)$  dislocations are observed primarily along both (111) directions in the glide plane. High-resolution transmission electron microscopy observations show that the core of the  $\alpha(101)$  dislocations along these directions is decomposed into two  $\alpha(010)$  dislocations, separated by a distance of approximately 2nm. The temperature window of stability for these  $\alpha(101)$  dislocations depends upon the strain rate. At a strain rate of  $1.4 \times 10^{-4}$ /s,  $\alpha(101)$  dislocations are observed between 800 and 1000K. Complete decomposition of  $\alpha(101)$  dislocations into  $\alpha(010)$  dislocations occurs beyond 1000K, leading to  $\alpha(010)$  climb as the deformation mode at higher temperature. At lower strain rates, decomposition of  $\alpha(101)$  dislocations has been observed to occur along the edge orientation at temperatures below 1000K. Embedded-atom method calculations and experimental results indicate that  $\alpha(101)$  dislocation have a large Peieris stress at low temperature. Based on the present microstructural observations and a survey of the literature with respect to vacancy content and diffusion in NiAl, a model is proposed for  $\alpha(101)(101)$  glide in Ni-44at.%Al, and for the observed yield strength versus temperature behavior of Ni-Al alloys at intermediate and high temperatures.

Research during the second year of the USC optical computing project demonstrated that imaging multivariate optical elements (IMOE) could be designed, fabricated and characterized. Results of the first MOE tests showed that the angle-independent performance anticipated in Y1 of this project is a practical possibility. Measurements were made on the UV-Vis, near-infrared and mid-infrared spectral characteristics of one bacterial spores type, specifically, the bacillus, BG, and comparisons to papers of many types were made. The results showed that these spores were distinguishable from typical papers in the UV-blue region, the 1500 nm region, and throughout the mid-IR. A prototype camera system based on an IMOE was constructed and demonstrated to work in the UV-Vis region.

### **Study of the Helicon Source Operation in the Variable Specific Impulse Magnetoplasma Rocket (VASIMR) Experiment**

Molvig, Kim; Batishchev, Oleg; [2003]; 37 pp.; In English

Contract(s)/Grant(s): NAG9-1455; No Copyright; Avail: CASI; [A03](#), Hardcopy

During this research period the following models of the VASIMR helicon discharge have been further developed and applied to analyze the on-going VX- 10 ASPL experiment: A) 1D semi-analytical model for a mixed-collisional propellant flow B) OD power and balance model for the whole helicon discharge In this particular research period we have concentrated on the MW-level performance of the VASIMR helicon source. Favorable high-power scaling and reduced ionization costs were obtained, and presented at the VASIMR NASA review in the Fall '02. This Grant is continuation of the previous NAG9-1224 award. The research results are summarized in 14 publications; they were presented as 20+ talks at the major International Conferences and scientific seminars at the leading Academic and Research Institutions. The reported results allowed helicon discharge characterization, understanding of the several experimental observations, and helped to make predictions and propose structural modifications for the advanced VASIMR helicon source operation.

### **Growing Larger Crystals for Neutron Diffraction**

Pusey, Marc; [2003]; 1 pp.; In English; 5th International Symposium on Organized Research Combination System, 19-21 Nov. 2003, Ibaraki, Japan; No Copyright; Avail: Other Sources; Abstract Only

Obtaining crystals of suitable size and high quality has been a major bottleneck in macromolecular crystallography. With the advent of advanced X-ray sources and methods the question of size has rapidly dwindled, almost to the point where if one can see the crystal then it was big enough. Quality is another issue, and major national and commercial efforts were established to take advantage of the microgravity environment in an effort to obtain higher quality crystals. Studies of the macromolecule crystallization process were carried out in many labs in an effort to understand what affected the resultant crystal quality on Earth, and how microgravity improved the process. While technological improvements are resulting in a diminishing of the minimum crystal size required, neutron diffraction structural studies still require considerably larger crystals, by several orders of magnitude, than X-ray studies. From a crystal growth physics perspective there is no reason why these 'large' crystals cannot be obtained: the question is generally more one of supply than limitations mechanism. This talk will discuss our laboratory's current model for macromolecule crystal growth, with highlights pertaining to the growth of crystals suitable for neutron diffraction studies.

A follow-up working conference was held at Lewis Research Center (now Glenn Research Center) on September 23-25, 1997, to continue discussing issues related to the development of Web-based education materials for the K-14 community. The conference continued the collaboration among the NASA aerospace technology Centers (Ames, Dryden, Langley, and Lewis [now Glenn]), NASA Headquarters, the University of Idaho and the Pennsylvania State University. The conference consisted of presentations by the Aeronautics Cooperative Agreement teams, and working sessions that addressed issues related to the conference theme, responding to the K-14 customers needs. The group identified the most significant issues by consensus. The issues addressed were: classroom access, World Wide Web resources, teacher training, different teaching and learning styles, interactivity, and education standards. The working sessions produced observations and recommendations in each of these areas in order to work toward the goal of making NASA sponsored Web-based educational resources useful to teachers and students.

**20030113145** NASA Glenn Research Center, Cleveland, OH, USA

#### **Concurrent and Collaborative Engineering Implementation in an R and D Organization**

DelRosario, Ruben; Davis, Jose M.; Keys, L. Ken; August 15, 2003; 5 pp.; In English; 2003 IEEE International Engineering Management Conference: Managing Technologically-Driven Organizations, 1-3 Nov. 2003, Albany, NY, USA

Contract(s)/Grant(s): WBS 22-080-50-20; No Copyright; Avail: CASI; [A01](#), Hardcopy

Concurrent Engineering (CE), and Collaborative Engineering (or Collaborative Product Development - CPD) have emerged as new paradigms with significant impact in the development of new products and processes. With documented and substantiated success in the automotive and technology industries CE and, most recently, CPD are being touted as innovative management philosophies for many other business sectors including Research and Development. This paper introduces two independent research initiatives conducted at the NASA Glenn Research Center (GRC) in Cleveland, Ohio investigating the application of CE and CPD in an R&D environment. Since little research has been conducted in the use of CE and CPD in sectors other than the high mass production manufacturing, the objective of these independent studies is to provide a systematic evaluation of the applicability of these paradigms (concurrent and collaborative) in a low/no production, service environment, in particular R&D.

Contract(s)/Grant(s): F33615-02-C-3207; Proj-2403

Report No.(s): AD-A418371; AFRL-VA-WP-TM-2003-3074; No Copyright; Avail: CASI; [A03](#), Hardcopy

This effort explores the management of information flows in a UAV. It is research into the information requirements for flying a UAV and how the quality of that information might be ascertained. This presentation looks at early results using information theory constructs to evaluate different information flows.

Report No.(s): AD-A418281; No Copyright; Avail: CASI; [A05](#), Hardcopy

By using visualization best practices and embedding them in information technology (IT), we believe that the Department of Defense can improve its ability to display multi-variant information. The focus of this research is to design a visual information solution, based on best practices for displaying performance data visually, to the Electronic Military Personnel Record System (EMPRS). Ultimately, our goal is to improve the overall effectiveness and objectivity of the Navy's selection board processes by providing a re-engineered, web-based, graphical solution to the visual displays currently in use by selection boards. The current Navy selection board voting process uses tabular forms displayed across five screens in a small theater-like setting. The forms are displayed very quickly allowing board members very little time to mentally assimilate the quantitative data dispersed over a wide area.

This document contains detailed summaries for each of the U.S. Army Research Institute's basic research contracts for the fiscal years 1998 - 2003. These summaries are grouped according to three Basic Research Office program objectives: Providing fundamental knowledge to improve training in complex, digital environments; providing fundamental knowledge to improve leader assessment and accelerate leader development; and providing fundamental knowledge for identifying and measuring the attributes and skills that are critical to soldier recruiting, performance, and retention in the transforming Army. In addition to summarizing what was done or is being done, each summary also describes the contributions of that research effort to basic behavioral science and suggests how the findings might benefit the Army and other military services.

**Dense Molecular Clumps in the Orion Bar Photo Dominated Region**

Lis, D. C.; Schilke, P.; [2003]; 12 pp.; In English

Contract(s)/Grant(s): NSF AST-22-09008

Report No.(s): Rept-2003-3; No Copyright; Avail: CASI; [A03](#), Hardcopy

We present high angular resolution observations of the Orion Bar photon dominated region (PDR) in optically thin H-13CN and H-13CO(+) (1-0) lines, obtained using the IRAM Plateau de Bure interferometer. At least ten spatially resolved molecular condensations are identified in the H-13CN image with virial masses in the range 0.5 - 1.5 solar mass. The median value of their H<sub>2</sub> volume density, approx.  $6 \times 10^{(exp 6)}/\text{cu cm}$ , is a factor of approx. 4 higher than the estimate based on previous PDR modeling of the main isotopomers of HCN and HCO(+). Since optically thin H-13CN emission is likely to trace the densest gas in the clump interiors, as compared to the main isotopomer, the H-13CN clumps appear to be close to virial equilibrium. The H-13CN fractional abundance is a factor of approx. 8 lower than that in the Orion Ridge, well shielded from the far-ultraviolet (FUV) photons (approx.  $1 \times 10^{(exp -10)}$ ). The H-13CN condensations can be described in the framework of models of photoevaporating clumps exposed to an intense flux of FUV photons. The derived clump parameters are consistent with models of clumps of turbulent origin that evolve, so that their column densities are equal to the critical value determined by the incident FUV field. In this case, the column densities of the H-13CN clumps seem high enough so that gravitational collapse can be triggered by the FUV-driven shock wave compression. The clumps may thus be collapsing to form low-mass stars. The observed H-13CN clump parameters are also consistent with pressure-confined clump models. However, in this case

the clumps would not be virialized and susceptible to gravitational collapse.

**RXTE and BeppoSAX Observations of MCG-5-23-16: Reflection From Distant Cold Material**

Mattson, B. J.; Weaver, K. A.; [2003]; 17 pp.; In English

Contract(s)/Grant(s): NAG5-4626; No Copyright; Avail: CASI; [A03](#), Hardcopy

We examine the spectral variability of the Seyfert 1.9 galaxy MCG-5-23-16 using RXTE and BeppoSAX observations spanning 2 years from April 1996 to April 1998. During the first year the X-ray source brightens by a factor of approximately 25% on timescales of days to months. During this time, the reprocessed continuum emission seen with RXTE does not respond measurably to the continuum increase. However, by the end of the second year during the BeppoSAX epoch the X-ray source has faded again. This time, the reprocessed emission has also faded, indicating that the reprocessed flux has responded to the continuum. If these effects are caused by time delays due to the distance between the X-ray source and the reprocessing region, we derive a light crossing time of between approximately 1 light day and approximately 1.5 light years. This corresponds to a distance of 0.001 pc to 0.55 pc, which implies that the reprocessed emission originates between  $3 \times 10^{15}$  cm and  $1.6 \times 10^{18}$  cm from the X-ray source. In other words, the reprocessing in MCG-5-23-16 is not dominated by the inner regions of a standard accretion disk.

**Transient Relativistically-Shifted Lines as a Probe of Black Hole Systems**

Turner, T. J.; Kraemer, S. B.; Reeves, J. N.; [2003]; 7 pp.; In English; No Copyright; Avail: CASI; [A02](#), Hardcopy

X-ray spectra of Seyfert-type Active Galaxies have revealed a new type of X-ray spectral feature, one which appears to offer important new insight into the black hole system. XMM revealed several narrow emission lines redward of Fe K $\alpha$  in NGC 3516. Since that discovery in NGC 3516, the phenomenon has been observed in other Seyfert galaxies, e.g. NGC 7314 and ESO 198-G24. We present new evidence for a redshifted Fe line in XMM spectra of Mrk 766. These data reveal the first evidence for a significant shift in the energy of a redshift Fe line, the shift occurs over just a few tens of kiloseconds. This shift may be interpreted as deceleration of ejected gas, the velocity of the material lies just above the escape velocity at the implied radial location of the emitter.

**The Radio Afterglow of GRB030329 at Centimetre Wavelengths: Evidence for Multiple Jets or a Structured Jet, Chapter 6**

Rol, E.; vanderHorst, A. J.; Wijers, R. A. M. J.; Strom, R.; Kaper, L.; Kouveliotou, C.; vandenHeuvel, E. P. J.; [2003]; 1 pp.; In English; No Copyright; Avail: Other Sources; Abstract Only

We present our centimetre wavelength (1.4, 2.3 and 4.9 GHz) light curves of the afterglow of GRB030329, which were obtained with the Westerbork Synthesis Radio Telescope. Modelling the data according to a collimated afterglow results in a jet-break time  $t(\text{sub } j)$  of 17 days. This is in contrast with earlier results obtained at higher frequencies, which indicate  $t(\text{sub } j)$  to be around 10 days. Furthermore, with respect to the afterglow model, some additional flux at the lower frequencies is present when these light curves reach their maximum. We subsequently show that the afterglow can be modelled with two or more components with progressively later jet breaks. From these results we infer that the jet is in fact a structured or a layered jet, where the ejecta with lower Lorentz factors produce additional flux which becomes visible at late times in the lowest frequency bands.

**Chandra Observations of the Faintest Low-Mass X-Ray Binaries**

Wilson, Colleen A.; Patel, Sandeep K.; Kouveliotou, Chryssa; Jonker, Peter G.; vanderKlis, Michiel; Lewin, Walter H. G.; Belloni, Tomaso; Mendez, Mariano; Astrophysical Journal; October 20, 2003; Volume 596, pp. 1220-1228; In English

Contract(s)/Grant(s): GO0-1054A; GO2-3046B; Copyright; Avail: Other Sources

A group of persistently faint Galactic X-ray sources exist that, based on their location in the Galaxy, high  $L(\text{sub X})/L(\text{sub opt})$ , association with X-ray bursts, and absence of low-frequency X-ray pulsations, are thought to be low-mass X-ray binaries (LMXBs). We present results from Chandra observations for eight of these systems: 4U 1708-408, 2S 1711-339, KS 1739-304, SLX 1735-269, GRS 1736-297, SLX 1746-331, 1E 1746.7-3224, and 4U 1812-12. Locations for all these sources, excluding GRS 1736-297, SLX 1746-331, and KS 1739-304 (which were not detected), were improved to 0.6 sec error circles (90% confidence). Our observations support earlier findings of transient behavior of GRS 1736-297, KS 1739-304, SLX 1746-331, and 2S 1711-339 (which we detect in one of two observations). Energy spectra for 4U 1708-408, 2S 1711-339, SLX 1735-269, 1E 1746.7-3224, and 4U 1812-12 are hard, with power-law indices typically 1.4-2.1, which is consistent with typical faint LMXB spectra.

#### **A Massive Warm Baryonic Halo in the Coma Cluster**

Bonamente, Massimiliano; Joy, Marshall K.; Lieu, Richard; The Astrophysical Journal; March 10, 2003; Volume 585, pp. 722-729; In English; Copyright; Avail: Other Sources

Several deep PSPC observations of the Coma Cluster reveal a very large scale halo of soft X-ray emission, substantially in excess of the well-known radiation from the hot intracluster medium. The excess emission, previously reported in the central region of the cluster using lower sensitivity Extreme Ultraviolet Explorer (EUVE) and ROSAT data, is now evident out to a radius of 2.6 Mpc, demonstrating that the soft excess radiation from clusters is a phenomenon of cosmological significance. The X-ray spectrum at these large radii cannot be modeled nonthermally but is consistent with the original scenario of thermal emission from warm gas at approx.  $10(\exp 6)$  K. The mass of the warm gas is on par with that of the hot X-ray-emitting plasma and significantly more massive if the warm gas resides in low-density filamentary structures. Thus, the data lend vital support to current theories of cosmic evolution, which predict that at low redshift approx. 30%-40% of the baryons reside in warm filaments converging at clusters of galaxies.

#### **Modeling the Extended Neutral Atmosphere and Plasma Environment near Saturn**

Richardson, John D.; [2003]; 3 pp.; In English

Contract(s)/Grant(s): NAG5-8947; No Copyright; Avail: CASI; [A01](#), Hardcopy

In the three years of this study we have published five papers in refereed journals. We have first examined satellite sources and their contribution to the observed neutral cloud. Based on the total calculated satellite sources and the spatial distribution of sputtered H<sub>2</sub>O, we concluded that they cannot produce observed OH cloud. The E-ring contribution has been also studied in detail. In order to produce observed OH cloud we suggested that the E-ring might be the dominant source in inner Saturnian magnetosphere. We proposed a possible resupply mechanism which is needed to keep both E-ring and OH cloud in the present state: collisions between E-ring grains and remains of a disrupted satellite near Enceladus Lagrangian points. In this scenario a large amount of material, ranging from a few micrometers to hundred of meters, which is optically invisible at present, is likely to exist there. The fourth paper compares the magnetosheaths of the outer planets. A surprising result is that the hot proton component comprises about 40% of the total density, much larger than predicted by shock theory. Gas dynamic models of the boundaries show that the magnetospheres of Jupiter and Saturn are flattened at the poles. The last paper was published in GRL and is the first based on the model of neutrals developed as a main goal of this grant and which is now operational. This Monte Carlo collision code self-consistently determines the neutral distribution from the rings and satellites until they are lost by ionization, by collisions with rings, moons, or Saturn, or by escape from Saturn. Our model is unique in that it includes the effects of plasma chemistry and both plasma-neutral and neutral-neutral collisions to determine the dynamical evolution of the water group neutrals in Saturn's magnetosphere. The lifetimes of the neutrals against loss to photoionization, charge exchange, electron dissociation and electron impact dissociation are based on the model given by (Richardson et al. 1998) and

vary with position in the magnetosphere. The dominant neutral dissociation channels  $\text{H}_2\text{O} \rightarrow \text{OH} + \text{H}$ ,  $\text{H}_2\text{O} \rightarrow \text{O} + \text{H}_2$ , and  $\text{OH} \rightarrow \text{O} + \text{H}_2$  are considered.

**Physical Studies of Brown Dwarfs and Extrasolar Planets**

Boyce, Joseph, Technical Monitor; Noll, Keith; September 12, 2003; 2 pp.; In English

Contract(s)/Grant(s): NAG5-8314; STScI Proj. J0179; No Copyright; Avail: CASI; [A01](#), Hardcopy

The primary activities supported under this grant included research into the mid-infrared spectral properties of brown dwarfs, with particular emphasis on the 3-4 micron region, the L band. Several observing trips were made to use facilities on Mauna Kea. The primary discovery was the detection of absorption due to  $\text{CH}_4$  in several L dwarfs, including one classified as an L5. This is significant since  $\text{CH}_4$  is usually considered to be the defining characteristic of T dwarfs. The stronger fundamental band at 3.3  $\mu\text{m}$ , however, makes it possible to observe the emergence of  $\text{CH}_4$  at hotter temperatures. A secondary result of this work is the surprising weakness of the  $\text{CH}_4$   $\nu_3$  band. This can be interpreted as either an indication that derived effective temperatures are too low, or perhaps, that the equilibrium abundance of  $\text{CH}_4$  is suppressed due to non-equilibrium processes at work in the atmosphere.

**Non-Thermal Hard X-Ray Emission in Galaxy Clusters Observed with the BeppoSAX PDS**

Nevalainen, J.; Oosterbroek, T.; Bonamente, M.; Colafrancesco, S.; [2003]; 1 pp.; In English; No Copyright; Avail: Other Sources; Abstract Only

We study the X-ray emission in a Sample of galaxy clusters using the BeppoSAX PDS instrument in the 20 - 80 keV energy band. We estimate the non-thermal hard X-ray cluster emission (HXR) by modeling the thermal contribution from the cluster gas and the non-thermal contamination from the unobscured AGN in the clusters. We also evaluate the systematic uncertainties due to the background fluctuations. Assuming negligible contamination from the obscured AGN, the resulting non-thermal component is detected at a 2 sigma level in approx. 50% of the non-significantly AGN-contaminated clusters: A2142, A2199, A2256, A3376, Coma, Ophiuchus and Virgo. The data are consistent with a scenario whereby relaxed clusters have no hard X-ray component of non-thermal origin, whereas merger clusters do. The co-added spectrum of the above clusters indicates a power-law spectrum for the HXR with a photon index of  $2.8 \pm 0.3 - 0.4$  in the 12 - 115 keV band, and we find indication that it has extended distribution. These indications argue against significant contamination from obscured AGN, which have harder spectra and centrally concentrated distribution. These results are supportive of the assumption of the merger shock acceleration of electrons in clusters, which has been proposed as a possible origin of the non-thermal hard X-ray emission models. Assuming that the Cosmic Microwave Background photons experience Inverse Compton scattering from the merger-accelerated relativistic electrons, and thus produce the observed HXR, the measured hard X-ray slope corresponds to a differential momentum spectra of the relativistic electrons with a slope of  $\mu = 3.8 - 5.0$ . In presence of cluster magnetic fields this relativistic electron population produces synchrotron emission with a spectral index of 1.4 - 2.1, consistent with radio halo observations of merger clusters. Thus both hard X-ray and radio observations of merger clusters are consistent with the Inverse Compton model. The observed slope of HXR is also consistent with that predicted by the non-thermal bremsstrahlung, which thus cannot be ruled by the fit to the current data, even though this model requires an extreme, untenable cluster energetics. Assuming centrally concentrated distribution of HXR, the data requires a harder slope for the HXR spectrum, which is consistent with secondary electron models, but this model yields a worse fit to the PDS data and thus seems to be disfavored over the primary electron Inverse Compton model.

### **High-Time-Resolution Study of Magnetic Holes in the Solar Wind**

Lazarus, Alan; Kasper, Justin; Stevens, Michael; January 2003; 3 pp.; In English

Contract(s)/Grant(s): NAG5-12793

Report No.(s): MIT-OSP-6894461; No Copyright; Avail: CASI; [A01](#), Hardcopy

The objectives of this investigation are to determine the internal plasma structure of kinetic-scale and larger scale magnetic holes, and to determine their stability, their source mechanism(s), and their spatial extent. It is also of importance to determine the relationship between kinetic-scale holes and long-duration holes. As smaller and smaller magnetic depressions are investigated in order to make this a complete study, a robust criterion is necessary for distinguishing magnetic holes from random or unresolvable fluctuations in the interplanetary magnetic field. In order to resolve this ambiguity, we obtained from the MFI experiments magnetic field measurements from the WIND spacecraft at a time resolution of 46 to 184 ms over certain periods. We have also devised a measure of certainty for magnetic hole detections. The certainty factor,  $q$ , is defined as the difference between the mean magnetic field in the hole and the local magnetic field, in units of the local standard deviation of the field strength. For fullest generality, it is necessary to calculate this  $q$  over the range of available scales of interest, from 60 ms up to 300 s. This technique establishes a two dimensional matrix of relative probabilities that a hole of some duration ( $d$ ) might exist in the data set at a given time ( $t$ ). In identifying  $q$ -peaks in time and duration, we also come upon a natural method for distinguishing holes with internal structure from multiple holes in close proximity or holes nested inside of others. If two  $q$ -peaks are more than a half-width apart, they are simply said to be separate events.

### **Thermal Contributions to the Degradation of Ground Laboratory and Space Irradiated Teflon**

deGroh, Kim K.; Martin, Morgana; [2003]; 34 pp.; In English; Copyright; Avail: CASI; [A03](#), Hardcopy

The aluminized Teflon fluorinated ethylene propylene outer most layer of the multilayer insulation blankets on the Hubble Space Telescope has become embrittled resulting in severe on-orbit cracking. During the second servicing mission, a piece of aluminized fluorinated ethylene propylene was retrieved that had curled, exposing the back-surface aluminum to space. This extremely embrittled piece reached 200 C on-orbit, 150 C higher than the nominal temperature extreme. Therefore, experiments have been conducted to determine the effect of heating on the degradation of fluorinated ethylene propylene that has been irradiated in a ground laboratory facility or in space on Hubble Space Telescope. Samples of pristine, x-ray irradiated and Hubble Space Telescope retrieved fluorinated ethylene propylene were heat treated from 50 to 200 C at 25 C intervals in a high vacuum facility and tensile tested. Density measurements were also obtained. Results indicate that heating does not embrittle non-irradiated Teflon. However, there is a significant dependence of the embrittlement of irradiated Teflon on heating temperature, with near complete loss of elongation at 100 C and higher. Rate of degradation changes, which were consistent with the glass transition temperature for fluorinated ethylene propylene, were present in the data. The results support chain scission as the primary mechanism of degradation of fluorinated ethylene propylene on Hubble Space Telescope, and indicate the significance of the on-orbit temperature of fluorinated ethylene propylene with respect to its degradation in the space environment.

**Multiparametric Determination of Radiation Risk**

Richmond, Robert C.; [2003]; 1 pp.; In English; NASA Cell Science Conference, 26-28 Feb. 2003, Palo Alto, CA, USA; No Copyright; Avail: Other Sources; Abstract Only

Predicting risk of human cancer following exposure to ionizing space radiation is challenging in part because of uncertainties of low-dose distribution amongst cells, of unknown potentially synergistic effects of microgravity upon cellular protein-expression, and of processing dose-related damage within cells to produce rare and late-appearing malignant transformation, degrade the confidence of cancer risk-estimates. The NASA- specific responsibility to estimate the risks of radiogenic cancer in a limited number of astronauts is not amenable to epidemiologic study, thereby increasing this challenge. Developing adequately sensitive cellular biodosimeters that simultaneously report 1) the quantity of absorbed dose after exposure to ionizing radiation, 2) the quality of radiation delivering that dose, and 3) the risk of developing malignant transformation by the cells absorbing that dose could be useful for resolving these challenges. Use of a multiparametric cellular biodosimeter is suggested using analyses of gene-expression and protein-expression whereby large datasets of cellular response to radiation-induced damage are obtained and analyzed for expression-profiles correlated with established end points and molecular markers predictive for cancer-risk. Analytical techniques of genomics and proteomics may be used to establish dose-dependency of multiple gene- and protein- expressions resulting from radiation-induced cellular damage. Furthermore, gene- and protein-expression from cells in microgravity are known to be altered relative to cells grown on the ground at 1g. Therefore, hypotheses are proposed that 1) macromolecular expression caused by radiation-induced damage in cells in microgravity may be different than on the ground, and 2) different patterns of macromolecular expression in microgravity may alter human radiogenic cancer risk relative to radiation exposure on Earth. A new paradigm is accordingly suggested as a national database wherein genomic and proteomic datasets are registered and interrogated in order to provide statistically significant dose-dependent risk estimation of radiogenic cancer in astronauts.

Impact of Quikscat Data on Numerical Weather Prediction – 23

Towards Improved MODIS Aerosol Retrieval over the US East Coast Region: Re-examining the Aerosol Model and Surface Assumptions – 25

Various Numerical Applications on Tropical Convective Systems Using a Cloud Resolving Model – 24

## ATOMIC CLOCKS

Maximizing the Stability of an Ensemble of Clocks – 12

## AUTOCORRELATION

Improved Target Identification of Correlated Input Data Using Recurrent Neural Networks and Feature Selection – 36

## AUTOMATIC CONTROL

Multilayer Optical Filters for Automatic Detection of Analytes in Mixtures with Interferants - Basic Research in Materials and Techniques – 40

## AUTONOMY

Quality of Information Metrics for Autonomous Decision Making – 42

## BACKSCATTERING

EOS-Aura's Ozone Monitoring Instrument (OMI): Validation Requirements – 18

## BACTERIA

Tindallia californiensis sp. nov., a new anaerobic, haloalkaliphilic, spore-forming acetogen isolated from Mono Lake in California – 32

## BANDWIDTH

Software, Programming, and Run-Time Coordination for Distributed Robotics – 36

## BARYONS

A Massive Warm Baryonic Halo in the Coma Cluster – 45

## BIOMASS BURNING

Effect of Smoke on Cloud Formation during the Biomass Burning Season over the Amazon Basin – 24

## BIOMEDICAL DATA

Hangtian Yixue Yu Yixue Gongcheng) Volume 15, Number 2, April 2002 – 33

## BISMALEIMIDE

New Polymers and Processes for Space Applications – 5

## BLACK HOLES (ASTRONOMY)

Transient Relativistically-Shifted Lines as a Probe of Black Hole Systems – 44

## BLENDED-WING-BODY CONFIGURATIONS

Embedded Wing Propulsion Conceptual Study – 3

## BLOOD

Folate and Breast Cancer: Role of Intake, Blood Levels and Metabolic Gene Polymorphisms – 29

## BOUNDARY CONDITIONS

Mean Flow Boundary Conditions for Computational Aeroacoustics – 16

## BRAIDED COMPOSITES

Mechanical Properties of Triaxial Braided Carbon/Epoxy Composites – 8

## BROWN DWARF STARS

Physical Studies of Brown Dwarfs and Extrasolar Planets – 46

## CALIBRATING

GOME Total Ozone and Calibration Error Derived Using Version 8 TOMS Algorithm – 17

## CALORIMETERS

Design and Performance Tests of Ultra-Compact Calorimeters for High Energy Astrophysics – 19

## CANCER

Beam Delivery Verification for Modulated Electron Radiation Therapy Treatment of Breast Cancer – 29

Breast Cancer Susceptibility Genes in High Risk Women – 28

Folate and Breast Cancer: Role of Intake, Blood Levels and Metabolic Gene Polymorphisms – 29

Gene Expression Analysis of Breast Cancer Progression – 31

Neural Protein Synuclein Gamma (SNCG) in Breast Cancer Progression – 29

Optimization of CAD System Using Adaptive Simulated Annealing for Digital Mammography – 28

Resonant Spectra of Malignant Breast Cancer Tumors Using the Three-Dimensional Electromagnetic Fast Multipole Model – 17

The Effect of COX-2 Inhibitors on the Aromatase Gene Expression in Human Breast Cancer – 31

The Role of MEK3 Signaling Pathway in the Resistance of Breast Cancer Cells to TNF- (alpha) -Mediated Apoptosis – 31

## CENTIMETER WAVES

The Radio Afterglow of GRB030329 at Centimetre Wavelengths: Evidence for Multiple Jets or a Structured Jet – 44

## CERAMIC MATRIX COMPOSITES

A Model for the Oxidation of C/SiC Composite Structures – 8

## CHEMICAL REACTIONS

Interactions of Water Vapor with Oxides at Elevated Temperatures – 10

## CHINA

Hangtian Yixue Yu Yixue Gongcheng) Volume 16, Number 2, April 2003 – 32

## CHROMOSOMES

The Significance of Genetic Representation in Genetic Antenna Design – 13

## CLIMATE CHANGE

SPARC-IGAC Symposium on Climate-Chemistry Interactions. Climate Feedback by Water Vapor in the Tropical Upper Troposphere – 27

## CLOUDS (METEOROLOGY)

Effect of Smoke on Cloud Formation during the Biomass Burning Season over the Amazon Basin – 24

Various Numerical Applications on Tropical Convective Systems Using a Cloud Resolving Model – 24

## CLUMPS

Dense Molecular Clumps in the Orion Bar Photo Dominated Region – 43

## COASTS

Towards Improved MODIS Aerosol Retrieval over the US East Coast Region: Re-examining the Aerosol Model and Surface Assumptions – 25

## COMBAT

Improving Aircraft Beddown: Estimates for Conducting Combat Operations – 37

The Development of the Tactical Medical Logistics Planning Tool (TML+) – 30

## COMBUSTION CHAMBERS

Dual-Spool Turbine Facility Design Overview – 5

## COMBUSTION CHEMISTRY

Reduced Equations for Calculating the Combustion Rates of Jet-A and Methane Fuel – 11

## COMBUSTION PHYSICS

Nucleation Behavior of Oxygen-Acetylene Torch-Produced Diamond Films – 7

## COMPOSITE STRUCTURES

A Model for the Oxidation of C/SiC Composite Structures – 8

Load Diffusion in Composite and Smart Structures – 21

## COMPUTATIONAL FLUID DYNAMICS

Investigation of the Flow Physics Driving Stall-Side Flutter in Advanced Forward Swept Fan Designs – 15

Using CFD as Rocket Injector Design Tool: Recent Progress at Marshall Space Flight Center – 16

## COMPUTER AIDED DESIGN

Optimization of CAD System Using Adaptive Simulated Annealing for Digital Mammography – 28

The Influence of Multimedia-Based Parent and Adolescent Interventions of Substance Abuse Among Poor Youth – 35

Viewing Technologies for Computer-Aided Design Models – 34

## COMPUTER PROGRAMMING

Viewing Technologies for Computer-Aided Design Models – 34

## COMPUTER PROGRAMS

A Template for Documenting Prediction-Enabled Component Technologies – 35

Software and Hardware Sound Analysis Tools for Field Work – 35

Software, Programming, and Run-Time Coordination for Distributed Robotics – 36

## COMPUTERIZED SIMULATION

The Development of the Tactical Medical Logistics Planning Tool (TML+) – 30

Validation of Variations in Mental Workload as a Function of Scenario Difficulty: Traffic Density and Visibility – 2

## CONCENTRATION (COMPOSITION)

In General, the Total Voltammetric Current from a Mixture of Redox-Active Substances will Not be the Sum of the Currents that Each Substance would Produce Independently at the Same Concentration as in the Mixture – 10

## CONCURRENT ENGINEERING

Concurrent and Collaborative Engineering Implementation in an R and D Organization – 42

## CONDENSED MATTER PHYSICS

Report on the NASA Soft and Complex Condensed Matter Workshop – 12

## CONFERENCES

Report on the NASA Soft and Complex Condensed Matter Workshop – 12

## CONSTRUCTION

Dual-Spool Turbine Facility Design Overview – 5

## CONTROL SYSTEMS DESIGN

Integration of Online Parameter Identification and Neural Network for In-Flight Adaptive Control – 4

## CONVERTERS

Vibration Testing of Stirling Power Convertors – 7

## COPPER INDIUM SELENIDES

Nanocrystalline Chalcopyrite Materials (CuInS<sub>2</sub> and CuInSe<sub>2</sub>) via Low-Temperature Pyrolysis of Molecular Single-Source Precursors – 9

## COPPER SULFIDES

Nanocrystalline Chalcopyrite Materials (CuInS<sub>2</sub> and CuInSe<sub>2</sub>) via Low-Temperature Pyrolysis of Molecular Single-Source Precursors – 9

## CROSS CORRELATION

Improved Target Identification of Correlated Input Data Using Recurrent Neural Networks and Feature Selection – 36

## CRYOGENICS

Ambient and Cryogenic Alignment Verification and Performance of the Infrared Multi-Object Spectrometer – 19

Optomechanical Alignment of the Grating Wheel Mechanism for a Ground-based, Cryogenic, Near-Infrared Astronomy Instrument – 19

## CRYSTAL DISLOCATIONS

Observations of Glide and Decomposition of  $a\langle 101 \rangle$  Dislocations at High Temperatures in Ni-Al Single Crystals Deformed along the Hard Orientation – 40

## CRYSTAL GROWTH

Growing Larger Crystals for Neutron Diffraction – 41

## CRYSTALLOGRAPHY

Growing Larger Crystals for Neutron Diffraction – 41

## CULTURAL RESOURCES

Use of GPR Surveys in Historical Archaeology Studies at Gainesville, Mississippi (22HA600) – 22

## DATA ACQUISITION

Assimilation of Satellite Ozone Observations – 17

Impact of Quikscat Data on Numerical Weather Prediction – 23

The Updated Umkehr Ozone Retrieval Algorithm and its Validation against Satellite Data – 26

## DATA BASES

Compendium of NASA Data Base for the Global Tropospheric Experiment's Transport and Chemical Evolution Over the Pacific (TRACE-P) – 22

## DECISION MAKING

Quality of Information Metrics for Autonomous Decision Making – 42

## DECISION SUPPORT SYSTEMS

A Method for Allocating Financial Resources to Combat Terrorism: Optimizing the Reduction of Consequences – 38

## DECOMPOSITION

Observations of Glide and Decomposition of  $a\langle 101 \rangle$  Dislocations at High Temperatures in Ni-Al Single Crystals Deformed along the Hard Orientation – 40

## DEFENSE PROGRAM

DoD Experience with the C4ISR Architecture Framework – 34

## DEGRADATION

Thermal Contributions to the Degradation of Ground Laboratory and Space Irradiated Teflon – 47

## DEOXYRIBONUCLEIC ACID

The Role of MEKK3 Signaling Pathway in the Resistance of Breast Cancer Cells to TNF- $\alpha$ -Mediated Apoptosis – 31

## DESIGN ANALYSIS

Design of an Effective Visualization for Naval Career Information Summary and Evaluation – 43

Dual-Spool Turbine Facility Design Overview – 5

## DETECTION

Multilayer Optical Filters for Automatic Detection of Analytes in Mixtures with Interferants - Basic Research in Materials and Techniques – 40

## DIAGNOSIS

Understanding Body-Fixed Sensor Output From Projectile Flight Experiments – 39

## DIAMOND FILMS

Nucleation Behavior of Oxygen-Acetylene Torch-Produced Diamond Films – 7

## DIFFUSION

Load Diffusion in Composite and Smart Structures – 21

## DIGITAL SYSTEMS

Optimization of CAD System Using Adaptive Simulated Annealing for Digital Mammography – 28

## DIURNAL VARIATIONS

Analysis of Diurnal, Planetary and Mean Wind Activity using TIMED, MF and Meteor Radar Winds – 28

## DOMAINS

Analysis on Lemniscates and Hamburger's Moments – 33

## DOPPLER RADAR

Analysis of Diurnal, Planetary and Mean Wind Activity using TIMED, MF and Meteor Radar Winds – 28

## DRUGS

The Influence of Multimedia-Based Parent and Adolescent Interventions of Substance Abuse Among Poor Youth – 35

## DYNAMIC PROGRAMMING

A Sensor Management Model Using Simulation-Based Approximate Dynamic Programming – 38

## DYNAMIC RESPONSE

Vibration Testing of Stirling Power Convertors – 7

## DYNAMIC STRUCTURAL ANALYSIS

Vibration Testing of Stirling Power Convertors – 7

## EARTH ATMOSPHERE

Aerosol Absorption in the Atmosphere: Perspectives from Global Model, Ground-Based Measurements, and Field Observations – 26

## EARTH OBSERVING SYSTEM (EOS)

EOS-Aura's Ozone Monitoring Instrument (OMI): Validation Requirements – 18

## EDUCATION

US Army Research Institute Program in Basic Research 2002-2003 – 43

Web-Based Instruction and Learning: Responding to K-14 Customer Needs – 41

## EFFECTIVENESS

Design of an Effective Visualization for Naval Career Information Summary and Evaluation – 43

## EJECTORS

Pulsed Ejector Wave Propagation Test Program – 3

## ELASTOPLASTICITY

Addendum to the User Manual for NAS-GRO Elastic-Plastic Fracture Mechanics Software Module – 21

## ELECTRIC BATTERIES

In-Situ, Time-Resolved Raman Spectromicro-topography of an Operating Lithium Ion Battery – 14

## ELECTRIC CURRENT

In General, the Total Voltammetric Current from a Mixture of Redox-Active Substances will Not be the Sum of the Currents that Each Substance would Produce Independently at the Same Concentration as in the Mixture – 10

## ELECTRIC PROPULSION

Next Generation of Hall Thrusters for Space Propulsion – 6

## ELECTROCHEMISTRY

In General, the Total Voltammetric Current from a Mixture of Redox-Active Substances will Not be the Sum of the Currents that Each Substance would Produce Independently at the Same Concentration as in the Mixture – 10

## ELECTRODES

In-Situ Raman Spectroscopy of Single Microparticle Li-Intercalation Electrodes – 9

## ELECTRON CYCLOTRON RESONANCE

Molecular Beam Epitaxy of Nitrides: Theoretical Modeling and Process Simulation – 10

## ELECTRON RADIATION

Beam Delivery Verification for Modulated Electron Radiation Therapy Treatment of Breast Cancer – 29

## ELECTRONIC MODULES

Software and Hardware Sound Analysis Tools for Field Work – 35

## EMISSION

Non-Thermal Hard X-Ray Emission in Galaxy Clusters Observed with the BepoSAX PDS – 46

## EMITTANCE

Synthesis and Luminescence of Yellow/Orange-Emitting Poly[tris(2,5-dihexyloxy-1,4-phenylenevinylene)-alt-(1,3-phenylenevinylene)]s – 9

## ENERGY CONVERSION

Monolithic Interconnected Modules (MIMs) for Thermophotovoltaic Energy Conversion – 14

## ENGINE AIRFRAME INTEGRATION

Embedded Wing Propulsion Conceptual Study – 3

## ENGINE DESIGN

Investigation of the Flow Physics Driving Stall-Side Flutter in Advanced Forward Swept Fan Designs – 15

## EPIDEMIOLOGY

Folate and Breast Cancer: Role of Intake, Blood Levels and Metabolic Gene Polymorphisms – 29

## EPOXY RESINS

Mechanical Properties of Triaxial Braided Carbon/Epoxy Composites – 8

## EXTRATERRESTRIAL RADIATION

Multiparametric Determination of Radiation Risk – 48

## FABRICATION

High Resolution, Single-Step Patterning of Silica Aerogels – 11

Monolithic Interconnected Modules (MIMs) for Thermophotovoltaic Energy Conversion – 14

Ruggedized Full-Color Flexible OLED Display – 13

## FANS

Investigation of the Flow Physics Driving Stall-Side Flutter in Advanced Forward Swept Fan Designs – 15

## FATIGUE (MATERIALS)

Acoustic Emission and Damage Monitoring During Fatigue of C-SiC Composites at Room Temperature – 8

## FEDERAL BUDGETS

A Method for Allocating Financial Resources to Combat Terrorism: Optimizing the Reduction of Consequences – 38

## FEMALES

Breast Cancer Susceptibility Genes in High Risk Women – 28

## FIBER COMPOSITES

Acoustic Emission and Damage Monitoring During Fatigue of C-SiC Composites at Room Temperature – 8

## FLEXIBILITY

Ruggedized Full-Color Flexible OLED Display – 13

## FLIGHT TESTS

Understanding Body-Fixed Sensor Output From Projectile Flight Experiments – 39

## FLOW DISTRIBUTION

Investigation of the Flow Physics Driving Stall-Side Flutter in Advanced Forward Swept Fan Designs – 15

Mean Flow Boundary Conditions for Computational Aeroacoustics – 16

## FLUTTER

Investigation of the Flow Physics Driving Stall-Side Flutter in Advanced Forward Swept Fan Designs – 15

## FORCED CONVECTION

Various Numerical Applications on Tropical Convective Systems Using a Cloud Resolving Model – 24

## FORMALISM

Analysis on Leminiscates and Hamburger's Moments – 33

## FRACTURE MECHANICS

Addendum to the User Manual for NAS-GRO Elastic-Plastic Fracture Mechanics Software Module – 21

## FRACTURE STRENGTH

New Polymers and Processes for Space Applications – 5

## FREQUENCY ASSIGNMENT

Dynamic Spectrum Allocation Algorithms – 38

## FREQUENCY DISTRIBUTION

Dynamic Spectrum Allocation Algorithms – 38

## GALACTIC CLUSTERS

A Massive Warm Baryonic Halo in the Coma Cluster – 45

Non-Thermal Hard X-Ray Emission in Galaxy Clusters Observed with the BepoSAX PDS – 46

## GALACTIC COSMIC RAYS

Design and Performance Tests of Ultra-Compact Calorimeters for High Energy Astrophysics – 19

## GALACTIC HALOS

A Massive Warm Baryonic Halo in the Coma Cluster – 45

## GALLIUM ARSENIDES

Progress in GaAs Metamorphic HEMT Technology for Microwave Applications. High Efficiency Ka-Band MHEMT Power MMICs – 14

## GALLIUM NITRIDES

Molecular Beam Epitaxy of Nitrides: Theoretical Modeling and Process Simulation – 10

## GAS DENSITY

Dense Molecular Clumps in the Orion Bar Photo Dominated Region – 43

## GENE EXPRESSION

Gene Expression Analysis of Breast Cancer Progression – 31

Neural Protein Synuclein Gamma (SNCG) in Breast Cancer Progression – 29

The Effect of COX-2 Inhibitors on the Aromatase Gene Expression in Human Breast Cancer – 31

## GENES

Beam Delivery Verification for Modulated Electron Radiation Therapy Treatment of Breast Cancer – 29

## GENETIC ALGORITHMS

The Significance of Genetic Representation in Genetic Antenna Design – 13

## GENETICS

Breast Cancer Susceptibility Genes in High Risk Women – 28

## GEOGRAPHIC INFORMATION SYSTEMS

Use of GPR Surveys in Historical Archaeology Studies at Gainesville, Mississippi (22HA600) – 22

## GROUND PENETRATING RADAR

Use of GPR Surveys in Historical Archaeology Studies at Gainesville, Mississippi (22HA600) – 22

## GROUND WATER

Satellite Interferometric Observations of Displacements Associated with Seasonal Groundwater in the Los Angeles Basin – 23

## HALL THRUSTERS

Next Generation of Hall Thrusters for Space Propulsion – 6

## HALOPHILES

Tindallia californiensis sp. nov., a new anaerobic, haloalkaliphilic, spore-forming acetogen isolated from Mono Lake in California – 32

## HELICOPTERS

Journal of Nanjing University of Aeronautics and Astronautics, Volume 35, Number 3, 2003 – 1

## HEURISTIC METHODS

Improving Aircraft Beddown: Estimates for Conducting Combat Operations – 37

## HIGH ELECTRON MOBILITY TRANSISTORS

Progress in GaAs Metamorphic HEMT Technology for Microwave Applications. High Efficiency Ka-Band MHEMT Power MMICs – 14

## HIGH RESOLUTION

Dense Molecular Clumps in the Orion Bar Photo Dominated Region – 43

## HIGH TEMPERATURE

Interactions of Water Vapor with Oxides at Elevated Temperatures – 10

Observations of Glide and Decomposition of  $a\langle 101 \rangle$  Dislocations at High Temperatures in Ni-Al Single Crystals Deformed along the Hard Orientation – 40

## HUMAN BEINGS

The Influence of Multimedia-Based Parent and Adolescent Interventions of Substance Abuse Among Poor Youth – 35

## HUMIDITY

Technical Report of National Aerospace Laboratory Management for the NAL 1.27m Hypersonic Wind Tunnel – 4

## HYPERSONIC WIND TUNNELS

Technical Report of National Aerospace Laboratory Management for the NAL 1.27m Hypersonic Wind Tunnel – 4

## IMAGING SPECTROMETERS

Derivation of Aerosol Columnar Mass from MODIS Optical Depth – 25

## IMAGING TECHNIQUES

Ambient and Cryogenic Alignment Verification and Performance of the Infrared Multi-Object Spectrometer – 19

Resonant Spectra of Malignant Breast Cancer Tumors Using the Three-Dimensional Electromagnetic Fast Multipole Model – 17

## IN SITU MEASUREMENT

In-Situ Raman Spectroscopy of Single Microparticle Li-Intercalation Electrodes – 9

## INCOMPRESSIBLE FLOW

Performance and Flow Regimes in Plane 2-D Diffusers With Exit Channels at Low Reynolds Numbers – 16

## INDIUM COMPOUNDS

Molecular Beam Epitaxy of Nitrides: Theoretical Modeling and Process Simulation – 10

## INDIUM SULFIDES

Nanocrystalline Chalcopyrite Materials (CuInS<sub>2</sub> and CuInSe<sub>2</sub>) via Low-Temperature Pyrolysis of Molecular Single-Source Precursors – 9

## INFORMATION THEORY

Quality of Information Metrics for Autonomous Decision Making – 42

## INFRARED ASTRONOMY

Optomechanical Alignment of the Grating Wheel Mechanism for a Ground-based, Cryogenic, Near-Infrared Astronomy Instrument – 19

## INFRARED SPECTROMETERS

Ambient and Cryogenic Alignment Verification and Performance of the Infrared Multi-Object Spectrometer – 19

## INHIBITORS

The Effect of COX-2 Inhibitors on the Aromatase Gene Expression in Human Breast Cancer – 31

## INJECTORS

Using CFD as Rocket Injector Design Tool: Recent Progress at Marshall Space Flight Center – 16

## INJURIES

The Development of the Tactical Medical Logistics Planning Tool (TML+) – 30

## INSTRUMENT ERRORS

GOME Total Ozone and Calibration Error Derived Using Version 8 TOMS Algorithm – 17

## INTEGRATED CIRCUITS

Monolithic Interconnected Modules (MIMs) for Thermophotovoltaic Energy Conversion – 14

## INTERCALATION

In-Situ Raman Spectroscopy of Single Microparticle Li-Intercalation Electrodes – 9

## INTERFEROMETERS

Analysis of Diurnal, Planetary and Mean Wind Activity using TIMED, MF and Meteor Radar Winds – 28

## INTERFEROMETRY

Ambient and Cryogenic Alignment Verification and Performance of the Infrared Multi-Object Spectrometer – 19

Satellite Interferometric Observations of Displacements Associated with Seasonal Groundwater in the Los Angeles Basin – 23

## IONIZING RADIATION

Multiparametric Determination of Radiation Risk – 48

## JET ENGINE FUELS

Reduced Equations for Calculating the Combustion Rates of Jet-A and Methane Fuel – 11

## JET ENGINES

A Simulation of the I3 to D Repair Process and Sparing of the F414-GE-400 Jet Aircraft Engine – 2

## JET FLOW

The Radio Afterglow of GRB030329 at Centimetre Wavelengths: Evidence for Multiple Jets or a Structured Jet – 44

## KINEMATICS

Understanding Body-Fixed Sensor Output From Projectile Flight Experiments – 39

## KINETIC EQUATIONS

Reduced Equations for Calculating the Combustion Rates of Jet-A and Methane Fuel – 11

## LAKES

Tindallia californiensis sp. nov., a new anaerobic, haloalkaliphilic, spore-forming acetogen isolated from Mono Lake in California – 32

## LAMINAR FLOW

Performance and Flow Regimes in Plane 2-D Diffusers With Exit Channels at Low Reynolds Numbers – 16

## LIGHT EMITTING DIODES

Ruggedized Full-Color Flexible OLED Display – 13

## LINE SPECTRA

Transient Relativistically-Shifted Lines as a Probe of Black Hole Systems – 44

## LITHIUM BATTERIES

In-Situ, Time-Resolved Raman Spectromicro-topography of an Operating Lithium Ion Battery – 14

## LITHIUM COMPOUNDS

In-Situ Raman Spectroscopy of Single Microparticle Li-Intercalation Electrodes – 9

## LOADS (FORCES)

Load Diffusion in Composite and Smart Structures – 21

## LOGISTICS

Improving Aircraft Beddown: Estimates for Conducting Combat Operations – 37

The Development of the Tactical Medical Logistics Planning Tool (TML+) – 30

## LOW GRAVITY MANUFACTURING

Report on the NASA Soft and Complex Condensed Matter Workshop – 12

## LOW REYNOLDS NUMBER

Performance and Flow Regimes in Plane 2-D Diffusers With Exit Channels at Low Reynolds Numbers – 16

## LOW TEMPERATURE

Nanocrystalline Chalcopyrite Materials (CuInS<sub>2</sub> and CuInSe<sub>2</sub>) via Low-Temperature Pyrolysis of Molecular Single-Source Precursors – 9

## LUMINESCENCE

Synthesis and Luminescence of Yellow/Orange-Emitting Poly[tris(2,5-dihexyloxy-1,4-phenylenevinylene)-alt-(1,3-phenylenevinylene)]s – 9

## MACROMOLECULES

Growing Larger Crystals for Neutron Diffraction – 41

## MAGNETIC MEASUREMENT

High-Time-Resolution Study of Magnetic Holes in the Solar Wind – 47

## MAGNETIC RESONANCE

Resonant Spectra of Malignant Breast Cancer Tumors Using the Three-Dimensional Electromagnetic Fast Multipole Model – 17

## MAGNETIC SPECTROSCOPY

Resonant Spectra of Malignant Breast Cancer Tumors Using the Three-Dimensional Electromagnetic Fast Multipole Model – 17

## MAGNETOHYDRODYNAMIC FLOW

Study of the Helicon Source Operation in the Variable Specific Impulse Magnetoplasma Rocket (VASIMR) Experiment – 41

## MAINTENANCE

A Simulation of the I3 to D Repair Process and Sparing of the F414-GE-400 Jet Aircraft Engine – 2

## MAMMARY GLANDS

Beam Delivery Verification for Modulated Electron Radiation Therapy Treatment of Breast Cancer – 29

Breast Cancer Susceptibility Genes in High Risk Women – 28

Folate and Breast Cancer: Role of Intake, Blood Levels and Metabolic Gene Polymorphisms – 29

Gene Expression Analysis of Breast Cancer Progression – 31

Neural Protein Synuclein Gamma (SNCG) in Breast Cancer Progression – 29

Optimization of CAD System Using Adaptive Simulated Annealing for Digital Mammography – 28

Resonant Spectra of Malignant Breast Cancer Tumors Using the Three-Dimensional Electromagnetic Fast Multipole Model – 17

The Effect of COX-2 Inhibitors on the Aromatase Gene Expression in Human Breast Cancer – 31

The Role of MEKK3 Signaling Pathway in the Resistance of Breast Cancer Cells to TNF- (alpha) -Mediated Apoptosis – 31

## MANAGEMENT

A Method for Allocating Financial Resources to Combat Terrorism: Optimizing the Reduction of Consequences – 38

A Sensor Management Model Using Simulation-Based Approximate Dynamic Programming – 38

## MARINE BIOLOGY

Effects of Underwater Noise on Marine Mammals – 39

## MARINE ENVIRONMENTS

Effects of Underwater Noise on Marine Mammals – 39

## MATHEMATICAL MODELS

A Method for Allocating Financial Resources to Combat Terrorism: Optimizing the Reduction of Consequences – 38

Existence of a Maximal Partial Spread of Size 76 in PG (3,9) – 33

Load Diffusion in Composite and Smart Structures – 21

Modeling Study of Planetary Waves in the Mesosphere Lower Thermosphere (MLT) – 26

Non-Migrating Tides, with Zonally Symmetric Component, Generated in the Mesosphere – 27

Target Position and Trajectory Measurements by Videogrammetry – 20

Thermodynamic Modeling of the YO(1.5)-ZrO<sub>2</sub> System – 15

## MATHEMATICS

Existence of a Maximal Partial Spread of Size 76 in PG (3,9) – 33

## MEDICAL EQUIPMENT

Hangtian Yixue Yu Yixue Gongcheng) Volume 16, Number 2, April 2003 – 32

## MEDICAL SCIENCE

Remote Access to Medical Specialists (RAMS) - Remote Patient Care Monitoring Test Bed – 30

## MEDICAL SERVICES

The Development of the Tactical Medical Logistics Planning Tool (TML+) – 30

## MENTAL PERFORMANCE

Validation of Variations in Mental Workload as a Function of Scenario Difficulty: Traffic Density and Visibility – 2

## MESOPHILES

Tindallia californiensis sp. nov., a new anaerobic, haloalkaliphilic, spore-forming acetogen isolated from Mono Lake in California – 32

## MESOSPHERE

Modeling Study of Planetary Waves in the Mesosphere Lower Thermosphere (MLT) – 26

Non-Migrating Tides, with Zonally Symmetric Component, Generated in the Mesosphere – 27

## METABOLISM

Folate and Breast Cancer: Role of Intake, Blood Levels and Metabolic Gene Polymorphisms – 29

## METAL IONS

In-Situ Raman Spectroscopy of Single Microparticle Li-Intercalation Electrodes – 9

## METHANE

Physical Studies of Brown Dwarfs and Extrasolar Planets – 46

Reduced Equations for Calculating the Combustion Rates of Jet-A and Methane Fuel – 11

## MICROPARTICLES

In-Situ Raman Spectroscopy of Single Microparticle Li-Intercalation Electrodes – 9

## MILITARY OPERATIONS

Improving Aircraft Beddown: Estimates for Conducting Combat Operations – 37

Remote Access to Medical Specialists (RAMS) - Remote Patient Care Monitoring Test Bed – 30

## MILKY WAY GALAXY

Chandra Observations of the Faintest Low-Mass X-Ray Binaries – 44

## MIXTURES

In General, the Total Voltammetric Current from a Mixture of Redox-Active Substances will Not be the Sum of the Currents that Each Substance would Produce Independently at the Same Concentration as in the Mixture – 10

## MODELS

A Sensor Management Model Using Simulation-Based Approximate Dynamic Programming – 38

## MODIS (RADIOMETRY)

Derivation of Aerosol Columnar Mass from MODIS Optical Depth – 25

Towards Improved MODIS Aerosol Retrieval over the US East Coast Region: Re-examining the Aerosol Model and Surface Assumptions – 25

## MODULES

Addendum to the User Manual for NAS-GRO Elastic-Plastic Fracture Mechanics Software Module – 21

Monolithic Interconnected Modules (MIMs) for Thermophotovoltaic Energy Conversion – 14

## MOLECULAR BEAM EPITAXY

Molecular Beam Epitaxy of Nitrides: Theoretical Modeling and Process Simulation – 10

## MOMENTS

Analysis on Leminiscates and Hamburger's Moments – 33

## MONOPOLE ANTENNAS

The Significance of Genetic Representation in Genetic Antenna Design – 13

## **MOSAICS**

NASA/USGS US Digital Landsat Moas-  
aics – 23

## **NANOCRYSTALS**

Nanocrystalline Chalcopyrite Materials  
(CuInS<sub>2</sub> and CuInSe<sub>2</sub>) via Low-  
Temperature Pyrolysis of Molecular  
Single-Source Precursors – 9

## **NASA PROGRAMS**

Mechanical Properties of Triaxial Braided  
Carbon/Epoxy Composites – 8

## **NEAR INFRARED RADIATION**

Optomechanical Alignment of the Grating  
Wheel Mechanism for a Ground-based,  
Cryogenic, Near-Infrared Astronomy In-  
strument – 19

## **NEURAL NETS**

Improved Target Identification of Correl-  
ated Input Data Using Recurrent Neural  
Networks and Feature Selection – 36

Integration of Online Parameter Identifi-  
cation and Neural Network for In-Flight  
Adaptive Control – 4

## **NEUTRON DIFFRACTION**

Growing Larger Crystals for Neutron Dif-  
fraction – 41

## **NICKEL ALUMINIDES**

Observations of Glide and Decomposi-  
tion of  $a<101>$  Dislocations at High Tem-  
peratures in Ni-Al Single Crystals De-  
formed along the Hard Orientation – 40

## **NITRIDES**

Molecular Beam Epitaxy of Nitrides:  
Theoretical Modeling and Process Simu-  
lation – 10

## **NUCLEAR MAGNETIC RESONANCE**

Nuclear Magnetic Resonance Spectrom-  
eter Console Upgrade for a Type II quan-  
tum Computer – 34

## **NUCLEATION**

Nucleation Behavior of Oxygen-  
Acetylene Torch-Produced Diamond  
Films – 7

## **NUMERICAL ANALYSIS**

Performance and Flow Regimes in Plane  
2-D Diffusers With Exit Channels at Low  
Reynolds Numbers – 16

## **NUMERICAL WEATHER FORECASTING**

Impact of Quikscat Data on Numerical  
Weather Prediction – 23

## **ONCOGENES**

Neural Protein Synuclein Gamma  
(SNCG) in Breast Cancer Progres-  
sion – 29

## **OPERATIONS RESEARCH**

Maximizing the Stability of an Ensemble  
of Clocks – 12

## **OPTICAL FILTERS**

Multilayer Optical Filters for Automatic  
Detection of Analytes in Mixtures with  
Interferants - Basic Research in Materi-  
als and Techniques – 40

## **OPTICAL MATERIALS**

Development of Nonlinear Optical Mate-  
rials (LBO, BBO, and KTP) for Use in  
High-Power Lasers – 20

## **OPTICAL PROPERTIES**

Aerospace Transparency Research  
Compendium – 2

## **OPTICAL THICKNESS**

Derivation of Aerosol Columnar Mass  
from MODIS Optical Depth – 25

## **OPTIMIZATION**

Maximizing the Stability of an Ensemble  
of Clocks – 12

Optimization of CAD System Using  
Adaptive Simulated Annealing for Digital  
Mammography – 28

## **ORGANIC MATERIALS**

Ruggedized Full-Color Flexible OLED  
Display – 13

## **OXIDATION-REDUCTION REACTIONS**

In General, the Total Voltammetric Cur-  
rent from a Mixture of Redox-Active Sub-  
stances will Not be the Sum of the Cur-  
rents that Each Substance would Pro-  
duce Independently at the Same  
Concentration as in the Mixture – 10

## **OXIDATION**

A Model for the Oxidation of C/SiC Com-  
posite Structures – 8

## **OXIDES**

Interactions of Water Vapor with Oxides  
at Elevated Temperatures – 10

## **OXYGEN**

Nucleation Behavior of Oxygen-  
Acetylene Torch-Produced Diamond  
Films – 7

## **OZONE**

Assimilation of Satellite Ozone Observa-  
tions – 17

EOS-Aura's Ozone Monitoring Instru-  
ment (OMI): Validation Require-  
ments – 18

The Updated Umkehr Ozone Retrieval  
Algorithm and its Validation against Sat-  
ellite Data – 26

## **PACIFIC OCEAN**

Compendium of NASA Data Base for the  
Global Tropospheric Experiment's Trans-  
port and Chemical Evolution Over the  
Pacific (TRACE-P) – 22

## **PARALLEL PROCESSING (COMPUTERS)**

Low-Complexity Interior Point Algorithms  
for Stochastic Programming: Derivation  
Analysis and Performance Evalua-  
tion – 37

## **PARAMETER IDENTIFICATION**

Integration of Online Parameter Identifi-  
cation and Neural Network for In-Flight  
Adaptive Control – 4

## **PARAMETERIZATION**

Derivation of Aerosol Columnar Mass  
from MODIS Optical Depth – 25

## **PATHOLOGY**

Neural Protein Synuclein Gamma  
(SNCG) in Breast Cancer Progres-  
sion – 29

## **PATIENTS**

Remote Access to Medical Specialists  
(RAMS) - Remote Patient Care Monitor-  
ing Test Bed – 30

## **PERFORMANCE TESTS**

Low-Complexity Interior Point Algorithms  
for Stochastic Programming: Derivation  
Analysis and Performance Evalua-  
tion – 37

## **PERSONNEL SELECTION**

Design of an Effective Visualization for  
Naval Career Information Summary and  
Evaluation – 43

## **PHASED ARRAYS**

Phased Array Antenna Testbed Develop-  
ment at the NASA Glenn Research Cen-  
ter – 13

## **PHENYLS**

Synthesis and Luminescence of  
Yellow/Orange-Emitting Poly[tris(2,5-  
dihexyloxy-1,4-phenylenevinylene)-alt-  
(1,3-phenylenevinylene)]s – 9

## **PHOTOGRAMMETRY**

Target Position and Trajectory Measure-  
ments by Videogrammetry – 20

## **PIEZOELECTRICITY**

Load Diffusion in Composite and Smart  
Structures – 21

## **PLANETARY MAGNETOSPHERES**

Modeling the Extended Neutral Atmo-  
sphere and Plasma Environment near  
Saturn – 45

## **PLANETARY WAVES**

Analysis of Diurnal, Planetary and Mean  
Wind Activity using TIMED, MF and Me-  
teor Radar Winds – 28

Modeling Study of Planetary Waves in  
the Mesosphere Lower Thermosphere  
(MLT) – 26

## **PLANNING**

The Development of the Tactical Medical  
Logistics Planning Tool (TML+) – 30

## **POLLUTION MONITORING**

Compendium of NASA Data Base for the  
Global Tropospheric Experiment's Trans-  
port and Chemical Evolution Over the  
Pacific (TRACE-P) – 22

## **POLYMERS**

Synthesis and Luminescence of  
Yellow/Orange-Emitting Poly[tris(2,5-  
dihexyloxy-1,4-phenylenevinylene)-alt-  
(1,3-phenylenevinylene)]s – 9

## **POLYMORPHISM**

Folate and Breast Cancer: Role of In-  
take, Blood Levels and Metabolic Gene  
Polymorphisms – 29

## **POSITION (LOCATION)**

Target Position and Trajectory Measure-  
ments by Videogrammetry – 20

## PREVENTION

The Influence of Multimedia-Based Parent and Adolescent Interventions of Substance Abuse Among Poor Youth – 35

## PRODUCT DEVELOPMENT

Concurrent and Collaborative Engineering Implementation in an R and D Organization – 42

Development of Nonlinear Optical Materials (LBO, BBO, and KTP) for Use in High-Power Lasers – 20

New Polymers and Processes for Space Applications – 5

## PROTECTION

The Influence of Multimedia-Based Parent and Adolescent Interventions of Substance Abuse Among Poor Youth – 35

## PROTEINS

Neural Protein Synuclein Gamma (SNCG) in Breast Cancer Progression – 29

## PULSE DETONATION ENGINES

Pulsed Ejector Wave Propagation Test Program – 3

## PYROLYSIS

Nanocrystalline Chalcopyrite Materials (CuInS<sub>2</sub> and CuInSe<sub>2</sub>) via Low-Temperature Pyrolysis of Molecular Single-Source Precursors – 9

## QUANTUM COMPUTERS

Nuclear Magnetic Resonance Spectrometer Console Upgrade for a Type II quantum Computer – 34

## QUIKSCAT SATELLITE

Impact of Quikscat Data on Numerical Weather Prediction – 23

## RADIATION DOSAGE

Multiparametric Determination of Radiation Risk – 48

## RADIATION THERAPY

Beam Delivery Verification for Modulated Electron Radiation Therapy Treatment of Breast Cancer – 29

## RADIO ASTRONOMY

The Radio Afterglow of GRB030329 at Centimetre Wavelengths: Evidence for Multiple Jets or a Structured Jet – 44

## RADIOGENIC MATERIALS

Multiparametric Determination of Radiation Risk – 48

## RAMAN SPECTRA

In-Situ, Time-Resolved Raman Spectromicro-topography of an Operating Lithium Ion Battery – 14

## RAMAN SPECTROSCOPY

In-Situ Raman Spectroscopy of Single Microparticle Li-Intercalation Electrodes – 9

## REAL TIME OPERATION

Abstract of talk for Silicon Valley Linux Users Group – 36

Software, Programming, and Run-Time Coordination for Distributed Robotics – 36

## RECEIVERS

Water Tunnel Downstream Array (ARL No. 02-16) Design and Test Report – 14

## RED SHIFT

Transient Relativistically-Shifted Lines as a Probe of Black Hole Systems – 44

## REFLECTION

RXTE and BeppoSAX Observations of MCG-5-23-16: Reflection From Distant Cold Material – 44

## RELATIVISTIC EFFECTS

Transient Relativistically-Shifted Lines as a Probe of Black Hole Systems – 44

## REMOTE CONTROL

Technical Report of National Aerospace Laboratory. Teleoperation with Time Delay. A Survey and Its Use in Space Robotics – 6

## REMOTE SENSING

Use of GPR Surveys in Historical Archaeology Studies at Gainesville, Mississippi (22HA600) – 22

## REMOTE SENSORS

A Sensor Management Model Using Simulation-Based Approximate Dynamic Programming – 38

## RESEARCH FACILITIES

Dual-Spool Turbine Facility Design Overview – 5

Phased Array Antenna Testbed Development at the NASA Glenn Research Center – 13

Using CFD as Rocket Injector Design Tool: Recent Progress at Marshall Space Flight Center – 16

## RESEARCH

Hangtian Yixue Yu Yixue Gongcheng) Volume 15, Number 2, April 2002 – 33

US Army Research Institute Program in Basic Research 2002-2003 – 43

## RESPONSES

Gene Expression Analysis of Breast Cancer Progression – 31

## RISK

A Method for Allocating Financial Resources to Combat Terrorism: Optimizing the Reduction of Consequences – 38

Breast Cancer Susceptibility Genes in High Risk Women – 28

## ROBOTICS

Software, Programming, and Run-Time Coordination for Distributed Robotics – 36

Technical Report of National Aerospace Laboratory. Teleoperation with Time Delay. A Survey and Its Use in Space Robotics – 6

## ROCKET ENGINE DESIGN

Using CFD as Rocket Injector Design Tool: Recent Progress at Marshall Space Flight Center – 16

## RUGGEDNESS

Ruggedized Full-Color Flexible OLED Display – 13

## SAGE SATELLITE

The Updated Umkehr Ozone Retrieval Algorithm and its Validation against Satellite Data – 26

## SATELLITE IMAGERY

NASA/USGS US Digital Landsat Moosaics – 23

## SATELLITE INSTRUMENTS

GOME Total Ozone and Calibration Error Derived Using Version 8 TOMS Algorithm – 17

New Total Ozone Algorithm for Application to the Total Ozone Mapping Spectrometer – 18

Towards Improved MODIS Aerosol Retrieval over the US East Coast Region: Re-examining the Aerosol Model and Surface Assumptions – 25

## SATELLITE OBSERVATION

Assimilation of Satellite Ozone Observations – 17

Satellite Interferometric Observations of Displacements Associated with Seasonal Groundwater in the Los Angeles Basin – 23

## SATELLITE-BORNE INSTRUMENTS

Assimilation of Satellite Ozone Observations – 17

## SATURN (PLANET)

Modeling the Extended Neutral Atmosphere and Plasma Environment near Saturn – 45

## SEASONS

Effect of Smoke on Cloud Formation during the Biomass Burning Season over the Amazon Basin – 24

## SELECTION

Design of an Effective Visualization for Naval Career Information Summary and Evaluation – 43

## SEYFERT GALAXIES

RXTE and BeppoSAX Observations of MCG-5-23-16: Reflection From Distant Cold Material – 44

Transient Relativistically-Shifted Lines as a Probe of Black Hole Systems – 44

## SIGNAL PROCESSING

Software and Hardware Sound Analysis Tools for Field Work – 35

## SILICON CARBIDES

A Model for the Oxidation of C/SiC Composite Structures – 8

Acoustic Emission and Damage Monitoring During Fatigue of C-SiC Composites at Room Temperature – 8

## SIMULATED ANNEALING

Optimization of CAD System Using Adaptive Simulated Annealing for Digital Mammography – 28

## SIMULATION

A Simulation of the I3 to D Repair Process and Sparing of the F414-GE-400 Jet Aircraft Engine – 2

## **SINGLE CRYSTALS**

Observations of Glide and Decomposition of a<101> Dislocations at High Temperatures in Ni-Al Single Crystals Deformed along the Hard Orientation – 40

## **SMART STRUCTURES**

Load Diffusion in Composite and Smart Structures – 21

## **SMOKE**

Effect of Smoke on Cloud Formation during the Biomass Burning Season over the Amazon Basin – 24

## **SOFTWARE ENGINEERING**

A Template for Documenting Prediction-Enabled Component Technologies – 35

## **SOLAR MAGNETIC FIELD**

High-Time-Resolution Study of Magnetic Holes in the Solar Wind – 47

## **SOLAR WIND**

High-Time-Resolution Study of Magnetic Holes in the Solar Wind – 47

## **SOUND FIELDS**

Software and Hardware Sound Analysis Tools for Field Work – 35

## **SPACE MISSIONS**

Thermal Contributions to the Degradation of Ground Laboratory and Space Irradiated Teflon – 47

## **SPACE PROCESSING**

Report on the NASA Soft and Complex Condensed Matter Workshop – 12

## **SPACE STATIONS**

Technical Report of National Aerospace Laboratory. Teleoperation with Time Delay. A Survey and Its Use in Space Robotics – 6

## **SPACE TECHNOLOGY EXPERIMENTS**

New Polymers and Processes for Space Applications – 5

## **SPACECRAFT CONFIGURATIONS**

Next Generation of Hall Thrusters for Space Propulsion – 6

## **SPACECRAFT INSTRUMENTS**

EOS-Aura's Ozone Monitoring Instrument (OMI): Validation Requirements – 18

Optomechanical Alignment of the Grating Wheel Mechanism for a Ground-based, Cryogenic, Near-Infrared Astronomy Instrument – 19

## **SPACECRAFT PROPULSION**

Next Generation of Hall Thrusters for Space Propulsion – 6

## **SPECTRA**

Dynamic Spectrum Allocation Algorithms – 38

## **SPECTROMETERS**

Abstract of talk for Silicon Valley Linux Users Group – 36

Nuclear Magnetic Resonance Spectrometer Console Upgrade for a Type II quantum Computer – 34

## **SPECTROSCOPY**

Synthesis and Luminescence of Yellow/Orange-Emitting Poly[tris(2,5-dihexyloxy-1,4-phenylenevinylene)-alt-(1,3-phenylenevinylene)]s – 9

## **STANDARDIZATION**

Aerospace Transparency Research Compendium – 2

## **STOCHASTIC PROCESSES**

Low-Complexity Interior Point Algorithms for Stochastic Programming: Derivation Analysis and Performance Evaluation – 37

## **STRUCTURAL BASINS**

Effect of Smoke on Cloud Formation during the Biomass Burning Season over the Amazon Basin – 24

## **SURVEYS**

Use of GPR Surveys in Historical Archaeology Studies at Gainesville, Mississippi (22HA600) – 22

## **SYMMETRY**

Non-Migrating Tides, with Zonally Symmetric Component, Generated in the Mesosphere – 27

## **SYNTHESIS (CHEMISTRY)**

Synthesis and Luminescence of Yellow/Orange-Emitting Poly[tris(2,5-dihexyloxy-1,4-phenylenevinylene)-alt-(1,3-phenylenevinylene)]s – 9

## **SYSTEMS INTEGRATION**

Integration of Online Parameter Identification and Neural Network for In-Flight Adaptive Control – 4

## **TACTICS**

The Development of the Tactical Medical Logistics Planning Tool (TML+) – 30

## **TARGET RECOGNITION**

Improved Target Identification of Correlated Input Data Using Recurrent Neural Networks and Feature Selection – 36

## **TECHNOLOGIES**

Viewing Technologies for Computer-Aided Design Models – 34

## **TECHNOLOGY ASSESSMENT**

Aerospace Transparency Research Compendium – 2

New Polymers and Processes for Space Applications – 5

## **TECHNOLOGY UTILIZATION**

Next Generation of Hall Thrusters for Space Propulsion – 6

## **TEFLON (TRADEMARK)**

Thermal Contributions to the Degradation of Ground Laboratory and Space Irradiated Teflon – 47

## **TELEROBOTICS**

Technical Report of National Aerospace Laboratory. Teleoperation with Time Delay. A Survey and Its Use in Space Robotics – 6

## **TEMPERATURE EFFECTS**

Thermal Contributions to the Degradation of Ground Laboratory and Space Irradiated Teflon – 47

## **TERRORISM**

A Method for Allocating Financial Resources to Combat Terrorism: Optimizing the Reduction of Consequences – 38

## **THERMODYNAMICS**

Interactions of Water Vapor with Oxides at Elevated Temperatures – 10

Thermodynamic Modeling of the YO(l.5)-ZrO<sub>2</sub> System – 15

## **THERMOPHOTOVOLTAIC CONVERSION**

Monolithic Interconnected Modules (MIMs) for Thermophotovoltaic Energy Conversion – 14

## **THERMOSPHERE**

Modeling Study of Planetary Waves in the Mesosphere Lower Thermosphere (MLT) – 26

## **TIDES**

Non-Migrating Tides, with Zonally Symmetric Component, Generated in the Mesosphere – 27

## **TIME FUNCTIONS**

In-Situ, Time-Resolved Raman Spectromicro-topography of an Operating Lithium Ion Battery – 14

## **TOPOGRAPHY**

In-Situ, Time-Resolved Raman Spectromicro-topography of an Operating Lithium Ion Battery – 14

## **TOTAL OZONE MAPPING SPECTROMETER**

GOME Total Ozone and Calibration Error Derived Using Version 8 TOMS Algorithm – 17

New Total Ozone Algorithm for Application to the Total Ozone Mapping Spectrometer – 18

## **TRACE CONTAMINANTS**

Dense Molecular Clumps in the Orion Bar Photo Dominated Region – 43

## **TRAJECTORIES**

Understanding Body-Fixed Sensor Output From Projectile Flight Experiments – 39

## **TRAJECTORY MEASUREMENT**

Target Position and Trajectory Measurements by Videogrammetry – 20

## **TROPICAL METEOROLOGY**

Various Numerical Applications on Tropical Convective Systems Using a Cloud Resolving Model – 24

## **TROPICAL REGIONS**

SPARC-IGAC Symposium on Climate-Chemistry Interactions. Climate Feedback by Water Vapor in the Tropical Upper Troposphere – 27

## **TROPOSPHERE**

Compendium of NASA Data Base for the Global Tropospheric Experiment's Transport and Chemical Evolution Over the Pacific (TRACE-P) – 22

SPARC-IGAC Symposium on Climate-Chemistry Interactions. Climate Feedback by Water Vapor in the Tropical Upper Troposphere – 27

**TUMORS**  
The Effect of COX-2 Inhibitors on the Aromatase Gene Expression in Human Breast Cancer – 31

**TURBOMACHINERY**  
Investigation of the Flow Physics Driving Stall-Side Flutter in Advanced Forward Swept Fan Designs – 15

**TWO DIMENSIONAL FLOW**  
Performance and Flow Regimes in Plane 2-D Diffusers With Exit Channels at Low Reynolds Numbers – 16

**TWO DIMENSIONAL MODELS**  
Various Numerical Applications on Tropical Convective Systems Using a Cloud Resolving Model – 24

**ULTRAVIOLET LASERS**  
Development of Nonlinear Optical Materials (LBO, BBO, and KTP) for Use in High-Power Lasers – 20

**UMKEHR EFFECT**  
The Updated Umkehr Ozone Retrieval Algorithm and its Validation against Satellite Data – 26

**UNDERGROUND STRUCTURES**  
Use of GPR Surveys in Historical Archaeology Studies at Gainesville, Mississippi (22HA600) – 22

**UNDERWATER ACOUSTICS**  
Effects of Underwater Noise on Marine Mammals – 39  
Water Tunnel Downstream Array (ARL No. 02-16) Design and Test Report – 14

**UNSTEADY AERODYNAMICS**  
Investigation of the Flow Physics Driving Stall-Side Flutter in Advanced Forward Swept Fan Designs – 15

**UNSTEADY FLOW**  
Mean Flow Boundary Conditions for Computational Aeroacoustics – 16

**USER MANUALS (COMPUTER PROGRAMS)**  
Addendum to the User Manual for NAS-GRO Elastic-Plastic Fracture Mechanics Software Module – 21

**VASIMR (PROPULSION SYSTEM)**  
Study of the Helicon Source Operation in the Variable Specific Impulse Magnetoplasma Rocket (VASIMR) Experiment – 41

**VIBRATION TESTS**  
Vibration Testing of Stirling Power Convertors – 7

**VIDEO EQUIPMENT**  
Target Position and Trajectory Measurements by Videogrammetry – 20

**VIEWING**  
Viewing Technologies for Computer-Aided Design Models – 34

**VISIBILITY**  
Validation of Variations in Mental Workload as a Function of Scenario Difficulty: Traffic Density and Visibility – 2

**VISUAL PERCEPTION**  
Design of an Effective Visualization for Naval Career Information Summary and Evaluation – 43

**WATER TUNNEL TESTS**  
Water Tunnel Downstream Array (ARL No. 02-16) Design and Test Report – 14

**WATER VAPOR**  
Interactions of Water Vapor with Oxides at Elevated Temperatures – 10  
SPARC-IGAC Symposium on Climate-Chemistry Interactions. Climate Feedback by Water Vapor in the Tropical Upper Troposphere – 27

**WIND (METEOROLOGY)**  
Analysis of Diurnal, Planetary and Mean Wind Activity using TIMED, MF and Meteor Radar Winds – 28

**WORKLOADS (PSYCHOPHYSIOLOGY)**  
Validation of Variations in Mental Workload as a Function of Scenario Difficulty: Traffic Density and Visibility – 2

**WORLD WIDE WEB**  
Web-Based Instruction and Learning: Responding to K-14 Customer Needs – 41

**X RAY ASTRONOMY**  
A Massive Warm Baryonic Halo in the Coma Cluster – 45  
Chandra Observations of the Faintest Low-Mass X-Ray Binaries – 44  
Non-Thermal Hard X-Ray Emission in Galaxy Clusters Observed with the BeppoSAX PDS – 46

**X RAY BINARIES**  
Chandra Observations of the Faintest Low-Mass X-Ray Binaries – 44

**X RAY IRRADIATION**  
Thermal Contributions to the Degradation of Ground Laboratory and Space Irradiated Teflon – 47

**X RAY SOURCES**  
Chandra Observations of the Faintest Low-Mass X-Ray Binaries – 44

**X RAY SPECTRA**  
RXTE and BeppoSAX Observations of MCG-5-23-16: Reflection From Distant Cold Material – 44  
Transient Relativistically-Shifted Lines as a Probe of Black Hole Systems – 44

**X RAY TIMING EXPLORER**  
RXTE and BeppoSAX Observations of MCG-5-23-16: Reflection From Distant Cold Material – 44

**YTTRIUM OXIDES**  
Thermodynamic Modeling of the YO(l.5)-ZrO2 System – 15

**ZIRCONIUM OXIDES**  
Thermodynamic Modeling of the YO(l.5)-ZrO2 System – 15

**ZONAL FLOW (METEOROLOGY)**  
Non-Migrating Tides, with Zonally Symmetric Component, Generated in the Mesosphere – 27
